More on Rankings

- Comparing results of Link Analysis Ranking algorithms
- Comparing and aggregating rankings

## Comparing LAR vectors

$$
\begin{aligned}
\square & \square \\
\square & \square \\
\mathrm{w}_{1} & =\left[\begin{array}{lllll}
1 & 0.8 & 0.5 & 0.3 & 0
\end{array}\right] \\
\mathrm{w}_{2} & =\left[\begin{array}{lllll}
0.9 & 1 & 0.7 & 0.6 & 0.8
\end{array}\right]
\end{aligned}
$$

- How close are the LAR vectors $w_{1}, w_{2}$ ?

## Distance between LAR vectors

- Geometric distance: how close are the numerical weights of vectors $w_{1}, w_{2}$ ?

$$
\begin{aligned}
& \mathrm{d}_{1}\left(\mathrm{w}_{1}, \mathrm{w}_{2}\right)=\sum\left|\mathrm{w}_{1}[\mathrm{i}]-\mathrm{w}_{2}[\mathrm{i}]\right| \\
& \square \square \square \square \square \\
& \mathrm{w}_{1}=\left[\begin{array}{lllll}
1.0 & 0.8 & 0.5 & 0.3 & 0.0
\end{array}\right] \\
& \mathrm{w}_{2}=\left[\begin{array}{lllll}
0.9 & 1.0 & 0.7 & 0.6 & 0.8
\end{array}\right] \\
& \mathrm{d}_{1}\left(\mathrm{w}_{1}, \mathrm{w}_{2}\right)=0.1+0.2+0.2+0.3+0.8=1.6
\end{aligned}
$$

## Distance between LAR vectors

- Rank distance: how close are the ordinal rankings induced by the vectors $w_{1}, w_{2}$ ?
- Kendal's t distance

$$
\mathrm{d}_{\mathrm{r}}\left(\mathrm{w}_{1}, \mathrm{w}_{2}\right)=\frac{\text { pairs ranked in a different order }}{\text { total number of distinct pairs }}
$$

## Outline

## Rank Aggregation

- Computing aggregate scores
- Computing aggregate rankings - voting

## Rank Aggregation

- Given a set of rankings $\mathrm{R}_{1}, \mathrm{R}_{2}, \ldots, \mathrm{R}_{\mathrm{m}}$ of a set of objects $X_{1}, X_{2}, \ldots, X_{n}$ produce a single ranking $R$ that is in agreement with the existing rankings

## Examples

- Voting
- rankings $R_{1}, R_{2}, \ldots, R_{m}$ are the voters, the objects $X_{1}, X_{2}, \ldots, X_{n}$ are the candidates.

## Examples

- Combining multiple scoring functions
- rankings $R_{1}, R_{2}, \ldots, R_{m}$ are the scoring functions, the objects $X_{1}, X_{2}, \ldots, X_{n}$ are data items.
- Combine the PageRank scores with termweighting scores
- Combine scores for multimedia items
- color, shape, texture
- Combine scores for database tuples
- find the best hotel according to price and location

## Examples

- Combining multiple sources
- rankings $R_{1}, R_{2}, \ldots, R_{m}$ are the sources, the objects $\mathrm{X}_{1}, \mathrm{X}_{2}, \ldots, \mathrm{X}_{\mathrm{n}}$ are data items.
- meta-search engines for the Web
- distributed databases
- P2P sources

## Variants of the problem

- Combining scores
- we know the scores assigned to objects by each ranking, and we want to compute a single score
- Combining ordinal rankings
- the scores are not known, only the ordering is known
- the scores are known but we do not know how, or do not want to combine them
- e.g. price and star rating

## Combining scores

- Each object $X_{i}$ has m scores ( $r_{i 1}, r_{i 2}, \ldots, r_{i m}$ )
- The score of object $X_{i}$ is computed using an aggregate scoring function $f\left(r_{i 1}, r_{i 2}, \ldots, r_{i m}\right)$

|  | $R_{1}$ | $R_{2}$ | $R_{3}$ |
| :---: | :---: | :---: | :---: |
| $X_{1}$ | 1 | 0.3 | 0.2 |
| $X_{2}$ | 0.8 | 0.8 | 0 |
| $X_{3}$ | 0.5 | 0.7 | 0.6 |
| $X_{4}$ | 0.3 | 0.2 | 0.8 |
| $X_{5}$ | 0.1 | 0.1 | 0.1 |

## Combining scores

- Each object $X_{i}$ has m scores ( $r_{i 1}, r_{i 2}, \ldots, r_{i m}$ )
- The score of object $X_{i}$ is computed using an aggregate scoring function $\mathrm{f}\left(\mathrm{r}_{\mathrm{i} 1}, \mathrm{r}_{\mathrm{i} 2}, \ldots, \mathrm{r}_{\mathrm{im}}\right)$
$-f\left(r_{i 1}, r_{i 2}, \ldots, r_{i m}\right)=\min \left\{r_{i 1}, r_{i 2}\right.$,
$\left.\ldots, r_{i m}\right\}$

|  | $R_{1}$ | $R_{2}$ | $R_{3}$ | $R$ |
| :---: | :---: | :---: | :---: | :---: |
| $X_{1}$ | 1 | 0.3 | 0.2 | 0.2 |
| $X_{2}$ | 0.8 | 0.8 | 0 | 0 |
| $X_{3}$ | 0.5 | 0.7 | 0.6 | 0.5 |
| $X_{4}$ | 0.3 | 0.2 | 0.8 | 0.2 |
| $X_{5}$ | 0.1 | 0.1 | 0.1 | 0.1 |

## Combining scores

- Each object $X_{i}$ has $m$ scores $\left(r_{i 1}, r_{i 2}, \ldots, r_{i m}\right)$
- The score of object $X_{i}$ is computed using an aggregate scoring function $f\left(r_{i 1}, r_{i 2}, \ldots, r_{i m}\right)$
$-f\left(r_{i 1}, r_{i 2}, \ldots, r_{i m}\right)=\max \left\{r_{i 1}, r_{i 2}\right.$, $\left.\ldots, r_{i m}\right\}$

|  | $R_{1}$ | $R_{2}$ | $R_{3}$ | $R$ |
| :---: | :---: | :---: | :---: | :---: |
| $X_{1}$ | 1 | 0.3 | 0.2 | 1 |
| $X_{2}$ | 0.8 | 0.8 | 0 | 0.8 |
| $X_{3}$ | 0.5 | 0.7 | 0.6 | 0.7 |
| $X_{4}$ | 0.3 | 0.2 | 0.8 | 0.8 |
| $X_{5}$ | 0.1 | 0.1 | 0.1 | 0.1 |

## Combining scores

- Each object $X_{i}$ has m scores $\left(r_{i 1}, r_{i 2}, \ldots, r_{i m}\right)$
- The score of object $X_{i}$ is computed using an aggregate scoring function $\mathrm{f}\left(\mathrm{r}_{\mathrm{i} 1}, \mathrm{r}_{\mathrm{i} 2}, \ldots, \mathrm{r}_{\mathrm{im}}\right)$
$-f\left(r_{i 1}, r_{i 2}, \ldots, r_{i m}\right)=r_{i 1}+r_{i 2}+\ldots+$ $r_{i m}$

|  | $\mathrm{R}_{1}$ | $\mathrm{R}_{2}$ | $\mathrm{R}_{3}$ | R |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{X}_{1}$ | 1 | 0.3 | 0.2 | 1.5 |
| $\mathrm{X}_{2}$ | 0.8 | 0.8 | 0 | 1.6 |
| $\mathrm{X}_{3}$ | 0.5 | 0.7 | 0.6 | 1.8 |
| $\mathrm{X}_{4}$ | 0.3 | 0.2 | 0.8 | 1.3 |
| $\mathrm{X}_{5}$ | 0.1 | 0.1 | 0.1 | 0.3 |

## Top-k

- Given a set of $n$ objects and $m$ scoring lists sorted in decreasing order, find the topobjects according to a scoring function $f$
- top-k: a set T of $k$ objects such that $f\left(r_{j 1}\right.$, $\left.\ldots, r_{j m}\right) \leq f\left(r_{i 1}, \ldots, r_{i m}\right)$ for every object $X_{i}$ in $T$ and every object $X_{j}$ not in $T$
- Assumption: The function f is monotone $-f\left(r_{1}, \ldots, r_{m}\right) \leq f\left(r_{1}{ }^{\prime}, \ldots, r_{m}{ }^{\prime}\right)$ if $r_{i} \leq r_{i}{ }^{\prime}$ for all $i$
- Objective: Compute top-k with the minimum cost

## Cost function

- We want to minimize the number of accesses to the scoring lists
- Sorted accesses: sequentially access the objects in the order in which they appear in a list
- cost $\mathrm{C}_{\mathrm{s}}$
- Random accesses: obtain the cost value for a specific object in a list
- cost Cr
- If $s$ sorted accesses and $r$ random accesses minimize $s C_{s}+r C_{r}$

## Example

- Compute top-2 for the sum aggregate function

## Fagin's Algorithm

1. Access sequentially all lists in parallel until there are $k$ objects that have been seen in all lists

| $R_{1}$ |  |
| :---: | :---: |
| $X_{1}$ | 1 |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.5 |
| $X_{4}$ | 0.3 |
| $X_{5}$ | 0.1 |

| $R_{2}$ |  |
| :--- | :--- |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.7 |
| $X_{1}$ | 0.3 |
| $X_{4}$ | 0.2 |
| $X_{5}$ | 0.1 |

| $R_{3}$ |  |
| :---: | :---: |
| $X_{4}$ | 0.8 |
| $X_{3}$ | 0.6 |
| $X_{1}$ | 0.2 |
| $X_{5}$ | 0.1 |
| $X_{2}$ | 0 |

## Fagin's Algorithm

1. Access sequentially all lists in parallel until there are $k$ objects that have been seen in all lists

| $R_{1}$ |  |
| :---: | :---: |
| $X_{1}$ | 1 |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.5 |
| $X_{4}$ | 0.3 |
| $X_{5}$ | 0.1 |$\quad$| $R_{2}$ |  |
| :---: | :---: |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.7 |
| $X_{1}$ | 0.3 |
| $X_{4}$ | 0.2 |
| $X_{5}$ | 0.1 |$\quad$| $R_{3}$ |  |
| :---: | :---: |
| $X_{4}$ | 0.8 |
| $X_{1}$ | 0.6 |
| $X_{5}$ | 0.1 |
| $X_{2}$ | 0 |

## Fagin's Algorithm

1. Access sequentially all lists in parallel until there are $k$ objects that have been seen in all lists

| $R_{1}$ |  |
| :---: | :---: |
| $X_{1}$ | 1 |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.5 |
| $X_{4}$ | 0.3 |
| $X_{5}$ | 0.1 |$\quad$| $R_{2}$ |  |
| :---: | :---: |
| $X_{2}$ | 0.8 |
|  | 0.7 |
| $X_{1}$ | 0.3 |
| $X_{4}$ | 0.2 |
| $X_{5}$ | 0.1 |$\quad$| $R_{3}$ |  |
| :---: | :---: |$\quad$|  | 0.8 |
| :---: | :---: |
| $X_{1}$ | 0.2 |
| $X_{5}$ | 0.1 |
| $X_{2}$ | 0 |

## Fagin's Algorithm

1. Access sequentially all lists in parallel until there are $k$ objects that have been seen in all lists

| $R_{1}$ |  |
| :---: | :---: |
| $X_{1}$ | 1 |
| $X_{2}$ | 0.8 |
|  | 0.5 |
| $X_{4}$ | 0.3 |
| $X_{5}$ | 0.1 |$\quad$| $R_{2}$ |  |
| :---: | :---: |
| $X_{2}$ | 0.8 |
|  | 0.7 |
| $X_{1}$ | 0.3 |
| $X_{4}$ | 0.2 |
| $X_{5}$ | 0.1 |$\quad$| $R_{3}$ |  |
| :---: | :---: | :---: |$\quad$|  | 0.8 |
| :---: | :---: |
| $X_{1}$ | 0.2 |
| $X_{2}$ | 0.1 |

## Fagin's Algorithm

1. Access sequentially all lists in parallel until there are $k$ objects that have been seen in all lists

| $\mathrm{R}_{1}$ |  | $\mathrm{R}_{2}$ |  | $\mathrm{R}_{3}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 |  | 0.8 |  | 0.8 |
|  | 0.8 |  | 0.7 |  | 0.6 |
|  | 0.5 |  | 0.3 |  | 0.2 |
| $\mathrm{X}_{4}$ | 0.3 | $\mathrm{X}_{4}$ | 0.2 | $\mathrm{X}_{5}$ | 0.1 |
| $\mathrm{X}_{5}$ | 0.1 |  | 0.1 | $\mathrm{X}_{2}$ | 0 |

## Fagin's Algorithm

2. Perform random accesses to obtain the scores of all seen objects

| $R_{1}$ |  |
| :---: | :---: |
| $X_{1}$ | 1 |
| $X_{2}$ | 0.8 |
|  | 0.5 |
| $X_{4}$ | 0.3 |
| $X_{5}$ | 0.1 |$\quad$| $R_{2}$ |  |
| :---: | :---: |
| $X_{2}$ | 0.8 |
|  | 0.7 |
| $X_{1}$ | 0.3 |
| $X_{4}$ | 0.2 |
| $X_{5}$ | 0.1 |$\quad$| $R_{3}$ |  |
| :---: | :---: |
| $X_{4}$ | 0.8 |
| $X_{5}$ | 0.2 |

## Fagin's Algorithm

3. Compute score for all objects and find the top-k

| $R_{1}$ |  |
| :---: | :---: |
| $X_{1}$ | 1 |
| $X_{2}$ | 0.8 |
|  | 0.5 |
| $X_{4}$ | 0.3 |
| $X_{5}$ | 0.1 |$\quad$| $R_{2}$ |  |
| :--- | :--- |
| $X_{2}$ | 0.8 |
|  | 0.7 |
| $X_{1}$ | 0.3 |
| $X_{4}$ | 0.2 |
| $X_{5}$ | 0.1 |$\quad$| $R_{3}$ |  |
| :---: | :---: |
| $X_{2}$ | 0.8 |
|  |  |

| $R$ |  |
| :--- | :--- |
| $X_{3}$ | 1.8 |
| $X_{2}$ | 1.6 |
| $X_{1}$ | 1.5 |
| $X_{4}$ | 1.3 |

## Fagin's Algorithm

- $X_{5}$ cannot be in the top- 2 because of the monotonicity property
$-f\left(X_{5}\right) \leq f\left(X_{1}\right) \leq f\left(X_{3}\right)$

| $\mathrm{R}_{1}$ |  | $\mathrm{R}_{2}$ |  | $\mathrm{R}_{3}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 |  | 0.8 |  | 0.8 |
|  | 0.8 |  | 0.7 |  | 0.6 |
|  | 0.5 |  | 0.3 |  | 0.2 |
|  | 0.3 |  | 0.2 | $\mathrm{X}_{5}$ | 0.1 |
| $\mathrm{X}_{5}$ | 0.1 |  |  |  | 0 |

| $R$ |  |
| :--- | :--- |
| $X_{3}$ | 1.8 |
| $X_{2}$ | 1.6 |
| $X_{1}$ | 1.5 |
| $X_{4}$ | 1.3 |

## Fagin's Algorithm

- The algorithm is cost optimal under some probabilistic assumptions for a restricted class of aggregate functions

## Threshold algorithm

## 1. Access the elements sequentially

| $R_{1}$ |  |
| :--- | :--- |
| $X_{1}$ | 1 |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.5 |
| $X_{4}$ | 0.3 |
| $X_{5}$ | 0.1 |

| $R_{2}$ |  |
| :--- | :--- |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.7 |
| $X_{1}$ | 0.3 |
| $X_{4}$ | 0.2 |
| $X_{5}$ | 0.1 |

| $R_{3}$ |  |
| :--- | :--- |
| $X_{4}$ | 0.8 |
| $X_{3}$ | 0.6 |
| $X_{1}$ | 0.2 |
| $X_{5}$ | 0.1 |
| $X_{2}$ | 0 |

## Threshold algorithm

## 1. At each sequential access

a. Set the threshold $t$ to be the aggregate of the scores seen in this access

| $R_{1}$ |  |
| :---: | :---: |
| $X_{1}$ | 1 |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.5 |
| $X_{4}$ | 0.3 |
| $X_{5}$ | 0.1 |$\quad$| $R_{2}$ |  |
| :---: | :---: |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.7 |
| $X_{1}$ | 0.3 |
| $X_{4}$ | 0.2 |
| $X_{5}$ | 0.1 |$\quad$| $R_{3}$ |  |
| :---: | :---: |
| $X_{3}$ | 0.8 |
| $X_{1}$ | 0.2 |
| $X_{5}$ | 0.1 |
| $X_{2}$ | 0 |

## Threshold algorithm

1. At each sequential access
b. Do random accesses and compute the score of the objects seen

| $R_{1}$ |  |
| :---: | :---: |
| $X_{1}$ | 1 |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.5 |
|  | 0.3 |
| $X_{5}$ | 0.1 |$\quad$| $R_{2}$ |  |
| :---: | :---: |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.7 |
| $X_{1}$ | 0.3 |
|  | 0.2 |
| $X_{5}$ | 0.1 |$\quad$| $R_{3}$ |  |
| :---: | :---: |
| $X_{3}$ | 0.8 |
| $X_{1}$ | 0.2 |
| $X_{5}$ | 0.1 |
| $X_{2}$ | 0 |

## Threshold algorithm

## 1. At each sequential access

c. Maintain a list of top-k objects seen so far

| $R_{1}$ |  |
| :---: | :---: |
| $X_{1}$ | 1 |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.5 |
| $X_{4}$ | 0.3 |
| $X_{5}$ | 0.1 |$\quad$| $R_{2}$ |  |
| :---: | :---: |
| $X_{2}$ | 0.8 |
| $X_{3}$ | 0.7 |
| $X_{1}$ | 0.3 |
| $X_{5}$ | 0.2 |
| $X_{2}$ | 0.1 |
| $X_{3}$ | 0.6 |
| $X_{1}$ | 0.2 |
| $X_{2}$ | 0.1 |

## Threshold algorithm

1. At each sequential access d. When the scores of the top-k are greater or equal to the threshold, stop

| $\mathrm{R}_{1}$ |  | $\mathrm{R}_{2}$ |  | $\mathrm{R}_{3}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 |  | 0.8 |  | 0.8 |
|  | 0.8 |  | 0.7 |  | 0.6 |
|  | 0.5 | $\mathrm{X}_{1}$ | 0.3 | $\mathrm{X}_{1}$ | 0.2 |
| $\mathrm{X}_{4}$ | 0.3 |  | 0.2 | $\mathrm{X}_{5}$ | 0.1 |
| $\mathrm{X}_{5}$ | 0.1 | $\mathrm{X}_{5}$ | 0.1 | $\mathrm{X}_{2}$ | 0 |

## Threshold algorithm

1. At each sequential access
d. When the scores of the top-k are greater or equal to the threshold, stop

| $\mathrm{R}_{1}$ |  | $\mathrm{R}_{2}$ |  | $\mathrm{R}_{3}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 |  | 0.8 |  | 0.8 |
|  | 0.8 |  | 0.7 |  | 0.6 |
|  | 0.5 |  | 0.3 |  | 0.2 |
| $\mathrm{X}_{4}$ | 0.3 |  | 0.2 | $\mathrm{x}_{5}$ | 0.1 |
|  | 0.1 |  | 0.1 | $\mathrm{X}_{2}$ | 0 |

## Threshold algorithm

2. Return the top-k seen so far

| $\mathrm{R}_{1}$ |  | $\mathrm{R}_{2}$ |  | $\mathrm{R}_{3}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 |  | 0.8 |  | 0.8 |
|  | 0.8 |  | 0.7 |  | 0.6 |
|  | 0.5 | $\mathrm{X}_{1}$ | 0.3 | $\mathrm{X}_{1}$ | 0.2 |
| $\mathrm{X}_{4}$ | 0.3 | $\mathrm{X}_{4}$ | 0.2 | $\mathrm{X}_{5}$ | 0.1 |
| $\mathrm{X}_{5}$ | 0.1 | $\mathrm{X}_{5}$ | 0.1 | $x_{2}$ | 0 |

## Threshold algorithm

- From the monotonicity property for any object not seen, the score of the object is less than the threshold $-\mathrm{f}\left(\mathrm{X}_{5}\right) \leq \mathrm{t} \leq \mathrm{f}\left(\mathrm{X}_{2}\right)$
- The algorithm is instance cost-optimal - within a constant factor of the best algorithm on any database

## Combining rankings

- In many cases the scores are not known
- e.g. meta-search engines - scores are proprietary information
- ... or we do not know how they were obtained
- one search engine returns score 10, the other 100. What does this mean?
- ... or the scores are incompatible
- apples and oranges: does it make sense to combine price with distance?
- In this cases we can only work with the rankings

## The problem

- Input: a set of rankings $\mathrm{R}_{1}, \mathrm{R}_{2}, \ldots, \mathrm{R}_{\mathrm{m}}$ of the objects $X_{1}, X_{2}, \ldots, X_{n}$. Each ranking $R_{i}$ is a total ordering of the objects
- for every pair $X_{i}, X_{j}$ either $X_{i}$ is ranked above $X_{j}$ or $X_{j}$ is ranked above $X_{i}$
- Output: A total ordering R that aggregates rankings $\mathrm{R}_{1}, \mathrm{R}_{2}, \ldots, \mathrm{R}_{\mathrm{m}}$

## Voting theory

- A voting system is a rank aggregation mechanism
- Long history and literature
- criteria and axioms for good voting systems

## What is a good voting system?

- The Condorcet criterion
- if object A defeats every other object in a pairwise majority vote, then A should be ranked first
- Extended Condorcet criterion
- if the objects in a set $X$ defeat in pairwise comparisons the objects in the set $Y$ then the objects in X should be ranked above those in Y
- Not all voting systems satisfy the Condorcet criterion!

## Pairwise majority comparisons

- Unfortunately the Condorcet winner does not always exist
- irrational behavior of groups

|  | $\mathrm{V}_{1}$ | $\mathrm{~V}_{2}$ | $\mathrm{~V}_{3}$ |
| :---: | :---: | :---: | :---: |
| 1 | A | B | C |
| 2 | B | C | A |
| 3 | C | A | B |

$$
A>B \quad B>C \quad C>A
$$

## Pairwise majority comparisons

- Resolve cycles by imposing an agenda

|  | $\mathrm{V}_{1}$ | $\mathrm{~V}_{2}$ | $\mathrm{~V}_{3}$ |
| :---: | :---: | :---: | :---: |
| 1 | A | D | E |
| 2 | B | E | A |
| 3 | C | A | B |
| 4 | D | B | C |
| 5 | E | C | D |

## Pairwise majority comparisons

- Resolve cycles by imposing an agenda

|  | $\mathrm{V}_{1}$ | $\mathrm{~V}_{2}$ | $\mathrm{~V}_{3}$ |
| :---: | :---: | :---: | :---: |
| 1 | A | D | E |
| 2 | B | E | A |
| 3 | C | A | B |
| 4 | D | B | C |
| 5 | E | C | D |

$$
\begin{gathered}
A \quad B \\
A
\end{gathered}
$$

## Pairwise majority comparisons

- Resolve cycles by imposing an agenda

|  | $\mathrm{V}_{1}$ | $\mathrm{~V}_{2}$ | $\mathrm{~V}_{3}$ |
| :---: | :---: | :---: | :---: |
| 1 | A | D | E |
| 2 | B | E | A |
| 3 | C | A | B |
| 4 | D | B | C |
| 5 | E | C | D |

## Pairwise majority comparisons

- Resolve cycles by imposing an agenda

|  | $\mathrm{V}_{1}$ | $\mathrm{~V}_{2}$ | $\mathrm{~V}_{3}$ |
| :---: | :---: | :---: | :---: |
| 1 | A | D | E |
| 2 | B | E | A |
| 3 | C | A | B |
| 4 | D | B | C |
| 5 | E | C | D |

## Pairwise majority comparisons

- Resolve cycles by imposing an agenda

|  | $\mathrm{V}_{1}$ | $\mathrm{~V}_{2}$ | $\mathrm{~V}_{3}$ |
| :---: | :---: | :---: | :---: |
| 1 | A | D | E |
| 2 | B | E | A |
| 3 | C | A | B |
| 4 | D | B | C |
| 5 | E | C | D |

- $C$ is the winner

## Pairwise majority comparisons

- Resolve cycles by imposing an agenda

|  | $\mathrm{V}_{1}$ | $\mathrm{~V}_{2}$ | $\mathrm{~V}_{3}$ |
| :---: | :---: | :---: | :---: |
| 1 | A | D | E |
| 2 | B | E | A |
| 3 | C | A | B |
| 4 | D | B | C |
| 5 | E | C | D |

- But everybody prefers A or B over C

# Pairwise majority comparisons 

- The voting system is not Pareto optimal
- there exists another ordering that everybody prefers
- Also, it is sensitive to the order of voting

## Plurality vote

- Elect first whoever has more 1st position votes

| voters | 10 | 8 | 7 |
| :---: | :---: | :---: | :---: |
| 1 | A | C | B |
| 2 | B | A | C |
| 3 | C | B | A |

- Does not find a Condorcet winner ( C in this case)

## Plurality with runoff

- If no-one gets more than $50 \%$ of the 1st position votes, take the majority winner of the first two

| voters | 10 | 8 | 7 | 2 |
| :---: | :---: | :---: | :---: | :---: |
| 1 | A | C | B | B |
| 2 | B | A | C | A |
| 3 | C | B | A | C |

first round: A 10, B 9, C 8 second round: A 18, B 9 winner: A

## Plurality with runoff

- If no-one gets more than $50 \%$ of the 1 st position votes, take the majority winner of the first two

| voters | 10 | 8 | 7 | 2 |
| :---: | :---: | :---: | :---: | :---: |
| 1 | A | C | B | A |
| 2 | B | A | C | B |
| 3 | C | B | A | C |

first round: A 12, B 7, C 8 second round: A 12, C 15 winner: C!

## Positive Association axiom

- Plurality with runoff violates the positive association axiom
- Positive association axiom: positive changes in preferences for an object should not cause the ranking of the object to decrease

## Borda Count

- For each ranking, assign to object $X$, number of points equal to the number of objects it defeats
- first position gets $n-1$ points, second $n-2$, ..., last 0 points
- The total weight of $X$ is the number of points it accumulates from all rankings

## Borda Count

| voters | 3 | 2 | 2 | $\begin{aligned} & \text { A: } 3 * 3+2 * 0+2 * 1=11 \mathrm{p} \\ & \text { B: } 3 * 2+2 * 3+2 * 0=12 \mathrm{p} \\ & \text { C: } 3 * 1+2 * 2+2 * 3=13 \mathrm{p} \\ & \text { D: } 3 * 0+2 * 1+2 * 2=6 \mathrm{p} \end{aligned}$ | BC |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 (3p) | A | B | C |  | C |
| 2 (2p) | B | C | D |  | B |
| 3 (1p) | C | D | A |  | A |
| 4 (0p) | D | A | B |  | D |

- Does not always produce Condorcet winner

## Borda Count

- Assume that D is removed from the vote

| voters | 3 | 2 | 2 | $\begin{aligned} & \text { A: } 3 * 2+2 * 0+2 * 1=7 p \\ & \text { B: } 3 * 1+2 * 2+2 * 0=7 p \\ & \text { C: } 3 * 0+2 * 1+2 * 2=6 p \end{aligned}$ | BC |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 (2p) | A | B | C |  | B |
| 2 (1p) | B | C | A |  | A |
| 3 (0p) | C | A | B |  | C |

- Changing the position of $D$ changes the order of the other elements!

## Independence of Irrelevant Alternatives

- The relative ranking of $X$ and $Y$ should not depend on a third object $Z$
- heavily debated axiom

## Borda Count

- The Borda Count of an an object $X$ is the aggregate number of pairwise comparisons that the object $X$ wins
- follows from the fact that in one ranking $X$ wins all the pairwise comparisons with objects that are under X in the ranking

## Voting Theory

- Is there a voting system that does not suffer from the previous shortcomings?

## Arrow's Impossibility Theorem

- No voting system satisfies the following axioms
- Universality
- all inputs are possible
- Completeness and Transitivity
- for each input we produce an answer and it is meaningful
- Positive Assosiation
- Promotion of a certain option cannot lead to a worse ranking of this option.
- Independence of Irrelevant Alternatives
- Changes in individuals' rankings of irrelevant alternatives (ones outside a certain subset) should have no impact on the societal ranking of the subset.
- Non-imposition
- Every possible societal preference order should be achievable by some set of individual preference orders
- Non-dictatoriship
- KENNETH J. ARROW Social Choice and Individual Values (1951). Won Nobel Prize in 1972

## Kemeny Optimal Aggregation

- Kemeny distance $K\left(R_{1}, R_{2}\right)$ : The number of pairs of nodes that are ranked in a different order (Kendall-tau)
- Kemeny optimal aggregation minimizes

$$
K\left(R, R_{1}, \ldots, R_{m}\right)=\sum_{i=1}^{m} K\left(R, R_{i}\right)
$$

- Kemeny optimal aggregation satisfies the Condorcet criterion and the extended Condorcet criterion
- ...but it is NP-hard to compute
- easy 2-approximation by obtaining the best of the input rankings, but it is not "interesting"

## Rankings as pairwise comparisons

- If element $u$ is before element $v$, then $u$ is preferred to $v$
- From input rankings output majority tournaments $G=(\mathrm{U}, \mathrm{A})$ :
- for $u, v$ in $U$, if the majority of the rankings prefer $u$ to $v$, then add $(u, v)$ to $A$

## The KwikSort algorithm

- KwikSort(G=(U,A))
- if $U$ is empty return empty list
- U1 = U2 = empty set
- pick random pivot u from U
- For all v in U<br>{u\} }
- if $(v, u)$ is in $A$ then add $v$ to $U 1$
- else add v to U2
- G1 = (U1,A1)
$-\mathrm{G} 2=(\mathrm{U} 2, \mathrm{~A} 2)$
- Return KwikSort(G1),u,KwikSort(G2)

## Properties of the KwikSort algorithm

- KwikSort algorithm is a 3-approximation algorithm to the Kemeny aggregation problem

## Locally Kemeny optimal aggregation

- A ranking R is locally Kemeny optimal if there is no bubble-sort swap of two consecutively placed objects that produces a ranking $R^{\prime}$ such that
- $K\left(R^{\prime}, R_{1}, \ldots, R_{m}\right) \leq K\left(R, R_{1}, \ldots, R_{m}\right)$
- Locally Kemeny optimal is not necessarily Kemeny optimal

## Locally Kemeny optimal aggregation

- Locally Kemeny optimal aggregation can be computed in polynomial time
- At the i-th iteration insert the i-th element $x$ in the bottom of the list, and bubble it up until there is an element $y$ such that the majority places y over $x$
- Locally Kemeny optimal aggregation satisfies the Condorcet and extended Condorcet criterion

## Rank Aggregation algorithm [DKNSO1]

- Start with an aggregated ranking and make it into a locally Kemeny optimal aggregation
- How do we select the initial aggregation?
- Use another aggregation method
- Create a Markov Chain where you move from an object $X$, to another object $Y$ that is ranked higher by the majority

## Spearman's footrule distance

- Spearman's footrule distance: The difference between the ranks $\mathrm{R}(\mathrm{i})$ and R'(i) assigned to object i

$$
F\left(R, R^{\prime}\right)=\sum_{i=1}^{n}\left|R(i)-R^{\prime}(i)\right|
$$

- Relation between Spearman's footrule and Kemeny distance

$$
K\left(R, R^{\prime}\right) \leq F\left(R, R^{\prime}\right) \leq 2 K\left(R, R^{\prime}\right)
$$

## Spearman's footrule aggregation

- Find the ranking $R$, that minimizes

$$
F\left(R, R_{1}, \ldots, R_{m}\right)=\sum_{i=1}^{m} F\left(R, R_{i}\right)
$$

- The optimal Spearman's footrule aggregation can be computed in polynomial time - It also gives a 2-approximation to the Kemeny optimal aggregation
- If the median ranks of the objects are unique then this ordering is optimal

## Example

A: $\left(1, \frac{2}{2}, 3\right)$
B: $\left(1, \frac{1}{2}, 2\right)$
C: $\left(2, \frac{3}{2}, 4\right)$
D: $(3,4,4)$

## The MedRank algorithm

- Access the rankings sequentially

| $\mathrm{R}_{1}$ |  |
| :--- | :--- |
| 1 | A |
| 2 | B |
| 3 | C |
| 4 | D |

| $R$ |  |
| :--- | :--- |
| 1 |  |
| 2 |  |
| 3 |  |
| 4 |  |

## The MedRank algorithm

- Access the rankings sequentially
- when an element has appeared in more than half of the rankings, output it in the aggregated ranking

| $R_{1}$ |  |
| :--- | :--- |
| 1 |  |
| 2 | $B$ |
| 3 | $C$ |
| 4 | $D$ |$\quad$| $R_{2}$ |  |
| :--- | :--- |
| 1 | $B$ |
| 2 | $A$ |
| 3 | $D$ |
| 4 | $C$ |$\quad$| $R_{3}$ |  |
| :--- | :--- |
| 1 | $B$ |
| 2 | $C$ |
| 3 | $A$ |
| 4 | $D$ |

| $R$ |  |
| :--- | :--- |
| 1 | $B$ |
| 2 |  |
| 3 |  |
| 4 |  |

## The MedRank algorithm

- Access the rankings sequentially
- when an element has appeared in more than half of the rankings, output it in the aggregated ranking

|  | $\mathrm{R}_{1}$ | $\mathrm{R}_{2}$ |  |  | $\mathrm{R}_{3}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 |  | 1 |  |  |  |  |
| 2 |  | 2 |  |  |  |  |
| 3 | C |  |  |  | A |  |
| 4 | D |  | C |  | D |  |

| $R$ |  |
| :--- | :--- |
| 1 | $B$ |
| 2 | $A$ |
| 3 |  |
| 4 |  |

## The MedRank algorithm

- Access the rankings sequentially
- when an element has appeared in more than half of the rankings, output it in the aggregated ranking

|  | $\mathrm{R}_{1}$ | $\mathrm{R}_{2}$ |  |  |  | $\mathrm{R}_{3}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 |  | 1 |  |  |  |  |  |
| 2 |  | 2 |  |  |  |  |  |
| 3 | - | 3 |  |  |  |  |  |
| 4 | D |  |  |  |  |  |  |

| R |  |
| :--- | :--- |
| 1 | B |
| 2 | A |
| 3 | C |
| 4 |  |

## The MedRank algorithm

| $\mathrm{R}_{1}$ |  | $\mathrm{R}_{2}$ |  | $\mathrm{R}_{3}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 |  | 1 | B | 1 | B |
| 2 | B | 2 |  | 2 | C |
| 3 | C | 3 | D | 3 |  |
| 4 | D | 4 | C | 4 | D |

| $R$ |  |
| :--- | :--- |
| 1 | $B$ |
| 2 | $A$ |
| 3 | $C$ |
| 4 | $D$ |

## The Spearman's rank correlation

- Spearman's rank correlation

$$
S\left(R, R^{\prime}\right)=\sum_{i=1}^{n}\left(R(i)-R^{\prime}(i)\right)^{2}
$$

- Computing the optimal rank aggregation with respect to Spearman's rank correlation is the same as computing Borda Count
- Computable in polynomial time

## Extensions and Applications

- Rank distance measures between partial orderings and top-k lists
- Similarity search
- Ranked Join Indices
- Analysis of Link Analysis Ranking algorithms
- Connections with machine learning
