# Privacy-Preserving Data Analysis

Want curators that are:

◆ Private

◆ Accurate

◆ Efficient

# Privacy-Preserving Data Analysis

Want curators that are: ♦Differentially Private      ♦Accurate for Learning Tasks      ♦Sample Efficient

# What can be Done with Differential Privacy?

Histograms [DMNS06]

Contingency tables [BCDKMT07, GHRU11, TUV12, DNT14]

PAC learning [BDMN05, KLNRS08]

Clustering [BDMN05, NRS07]

...and much more!

Streaming algorithms [DNRY10, DNPR10, MMNW11]

SVD [HR12, HR13, KT13, DTTZ14]

Mechanism Design [MT07, NST10, X11, NOS12, CCKMV12, HK12, KPRU12]

Question: Can these tasks be performed as efficiently as their non-private counterparts?

**This work:** Sample complexity of privately PAC learning multiple concepts over the same example set

# PAC Learning [Valiant84]

Gender	Age	4Chan?	MLP:FiM
M	38	Y	1
F	6	N	1
F	34	N	0
...			
M	27	N	0

M	31	Y	→ h →	1
---	----	---	-------	---

$h = ((\text{Age} < 10) \text{ AND } (\text{Gender} = \text{F})) \text{ OR } ((17 < \text{Age} < 40) \text{ AND } (\text{Gender} = \text{M}) \text{ AND } (4\text{Chan?} = \text{Y}))$

# PAC Learning [Valiant84]

Gender	Age	4Chan?	MLP:FiM
M	38	Y	1
F	6	N	1
F	34	N	0
...			
M	27	N	0

F	65	N	→	h	→	0
---	----	---	---	---	---	---

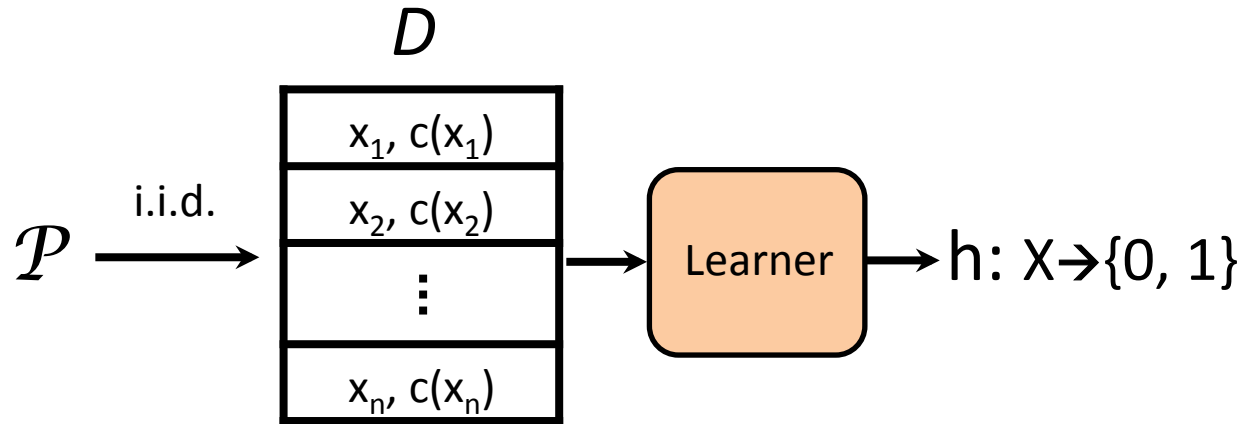

$h = ((\text{Age} < 10) \text{ AND } (\text{Gender} = \text{F})) \text{ OR } ((17 < \text{Age} < 40) \text{ AND } (\text{Gender} = \text{M}) \text{ AND } (4\text{Chan?} = \text{Y}))$

# PAC Learning [Valiant84]

$\mathcal{P}$  = unknown distribution over domain  $X$

$\mathcal{C}$  = concept class  $\{c: X \rightarrow \{0, 1\}\}$  e.g. DNF of intervals

Fact:  $n = \Theta(\text{VC}(\mathcal{C}))$  samples suffice to generalize

$\text{VC}(\mathcal{C}) \leq \log |\mathcal{C}|$ , but can be much smaller

# PAC *Multi*-Learning [Valiant06]

Gender	Age	4Chan?	MLP:FiM
M	38	Y	1
F	6	N	1
F	34	N	0
...			
M	27	N	0

F	65	N	→ h →	0
---	----	---	-------	---

# PAC *Multi-Learning* [Valiant06]

Gender	Age	4Chan?		MLP:FiM	AdvTime	A:tLA	Dora
M	38	Y		1	1	1	0
F	6	N		1	0	0	0
F	34	N		0	0	1	0
...							
M	27	N		0	1	0	0

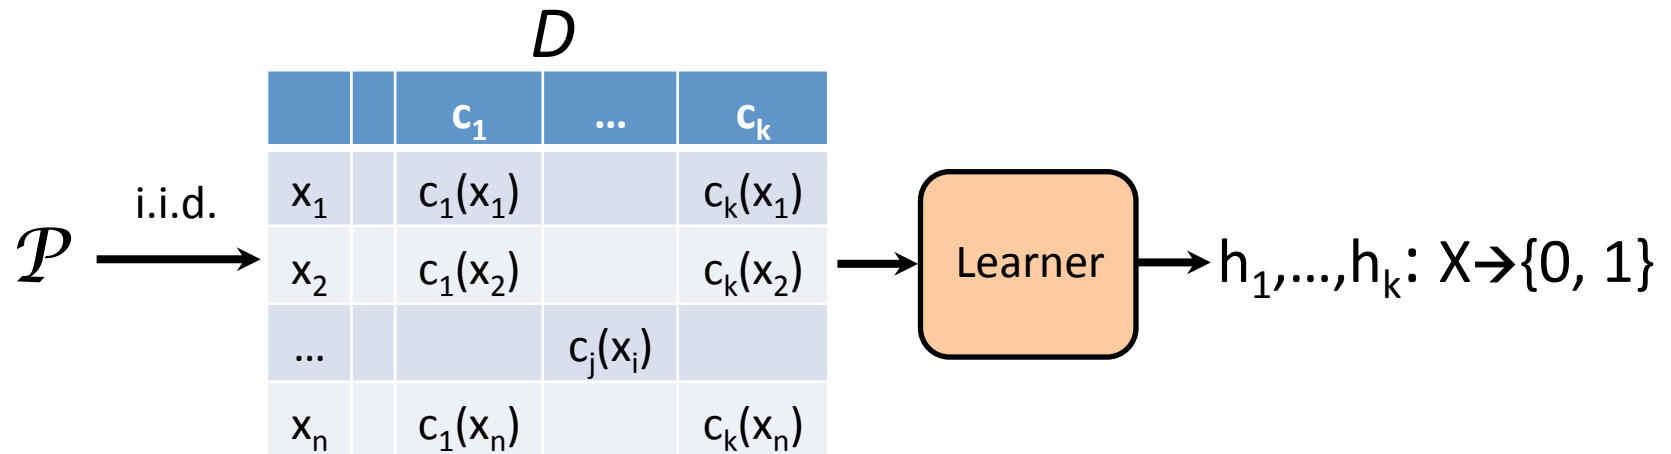

F	65	N	→	<b>h</b>	→	0	0	1	0
---	----	---	---	----------	---	---	---	---	---

# PAC *Multi-Learning* [Valiant06]

$\mathcal{P}$  = unknown distribution over domain  $X$

$\mathcal{C}$  = concept class  $\{c: X \rightarrow \{0, 1\}\}$

Goal: For all  $\mathcal{P}$  and  $c_1, \dots, c_k \in \mathcal{C}$ , output  $\mathbf{h}$   
s.t.

$h_i \approx c_i$  on  $\mathcal{P}$  for every  $i=1, \dots, k$

# PAC *Multi-Learning* [Valiant06]

$\mathcal{P}$  = unknown distribution over domain  $X$

$\mathcal{C}$  = concept class  $\{c: X \rightarrow \{0, 1\}\}$

Fact:  $n = \Theta(\text{VC}(\mathcal{C}))$  samples suffice to generalize

Uniform convergence: Over a random sample  $S$  of size  $O_{\alpha, \beta}(\text{VC}(\mathcal{C}))$ ,

$$\Pr[\exists f, g \in \mathcal{C} : (f|_S = g|_S) \wedge \text{err}_P(f, g) > \alpha] \leq \beta$$

# What about Privacy?

Gender	Age	4Chan?		MLP:FiM	AdvTime	A:tLA	Dora
M	38	Y		1	1	1	0
F	6	N		1	0	0	0
F	34	N		0	0	1	0
...							
M	27	N		0	1	0	0

The data is anonymized, so it's safe to release, right?

F	65	N	→	<b>h</b>	→	0	0	1	0
---	----	---	---	----------	---	---	---	---	---

# What about Privacy?

Gender	Age	4Chan?	MLP:FiM
M	38	Y	1
F	6	N	1
F	34	N	0
...			
M	27	N	0

The data is anonymized, so it's safe to release, right?

F	65	N	→ <b>h</b> →	0
---	----	---	--------------	---

**DMNS06, DKMMN06**

**Question:** How does the sample complexity depend on  $k$ ?

# Samp. Cx. of Private Multi-Learning

- For  $k = 1$ , can privately learn  $\mathcal{C}$  with sample complexity  $n = \text{SCDP}_1(\mathcal{C})$  where:

$$\text{VC}(\mathcal{C}) \leq \text{SCDP}_1(\mathcal{C}) \leq \log |\mathcal{C}| \quad [\text{KLNRS08}]$$

- For arbitrary  $k$ , can learn each concept independently:  $\text{SCDP}_k(\mathcal{C}) \leq k^{1/2} \text{SCDP}_1(\mathcal{C})$  [DRV10]
- Can we do better? Is the dependence on  $k$  necessary?

# Our Results

Upper bounds:

$C$	PAC learning (proper and improper)	Agnostic learning (proper and improper)
$\text{POINT}_X$	1	$\sqrt{k}$
$\text{THRESH}_X$	$2^{\log^*  X } + \sqrt{k}$	
General $C$	$\min\{\sqrt{k} \log  C , \sqrt{k} \text{VC}(C) + \log  X  \text{VC}(C), \sqrt{k} \text{VC}(C) + \sqrt{\log  X } \log  C \}$	
$\text{PAR}_d$ (uniform)	$\log  C $	$\sqrt{k} \log  C $

Lower bounds:

$C$	PAC learning		Agnostic learning	
	proper	improper	proper	improper
$\text{POINT}_X$	1		$\sqrt{k}$	
$\text{THRESH}_X$	$\log^*  X  + k^{1/3}$	$k^{1/3}$	$\log^*  X  + \sqrt{k}$	$\sqrt{k}$
$\text{PAR}_d$ (uniform)	$\log  C $		$\sqrt{k} + \log  C $	

# Our Results (Human Readable Version)

- Upper bounds

- Generic multi-learner achieving

$$\text{SCDP}_k(\mathcal{C}) \leq \boxed{\text{VC}(\mathcal{C}) \log |X|} + k^{1/2} \boxed{\text{VC}(\mathcal{C})}$$

Fixed cost

Marginal cost  $\leq \text{SCDP}_1(\mathcal{C})$

- Improved multi-learners for specific classes

- Lower bounds via fingerprinting codes

- $k^{1/3}$  lower bound for multi-learning thresholds

- $k^{1/2}$  lower bound for agnostically learning...

...anything

# Threshold Functions

$X$  a totally ordered domain

$$\mathcal{C} = \{f_t : f_t(x) = 1 \text{ iff } x \leq t\}$$

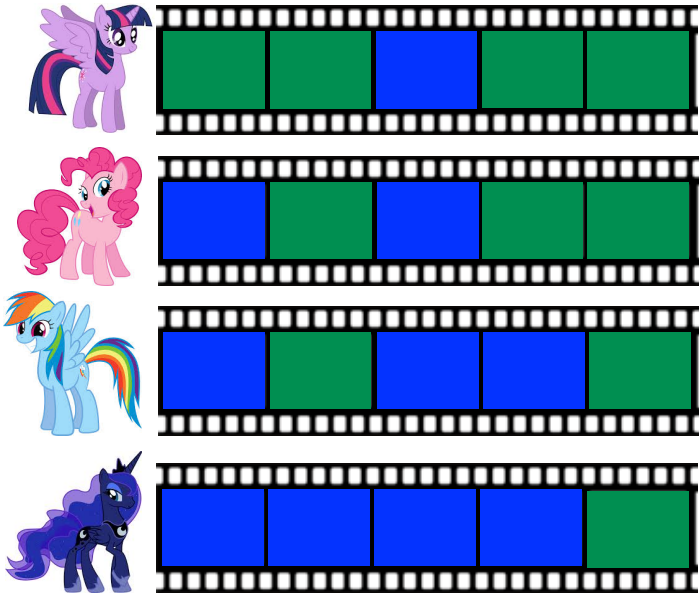

# Fingerprinting Codes [Boneh-Shaw95]

I want to distribute my new movie

Pirate

Trace Algorithm

...but Equestria is full of pirates!

# Fingerprinting Codes [Boneh-Shaw95]

I want to distribute my new movie

Pirate algorithm

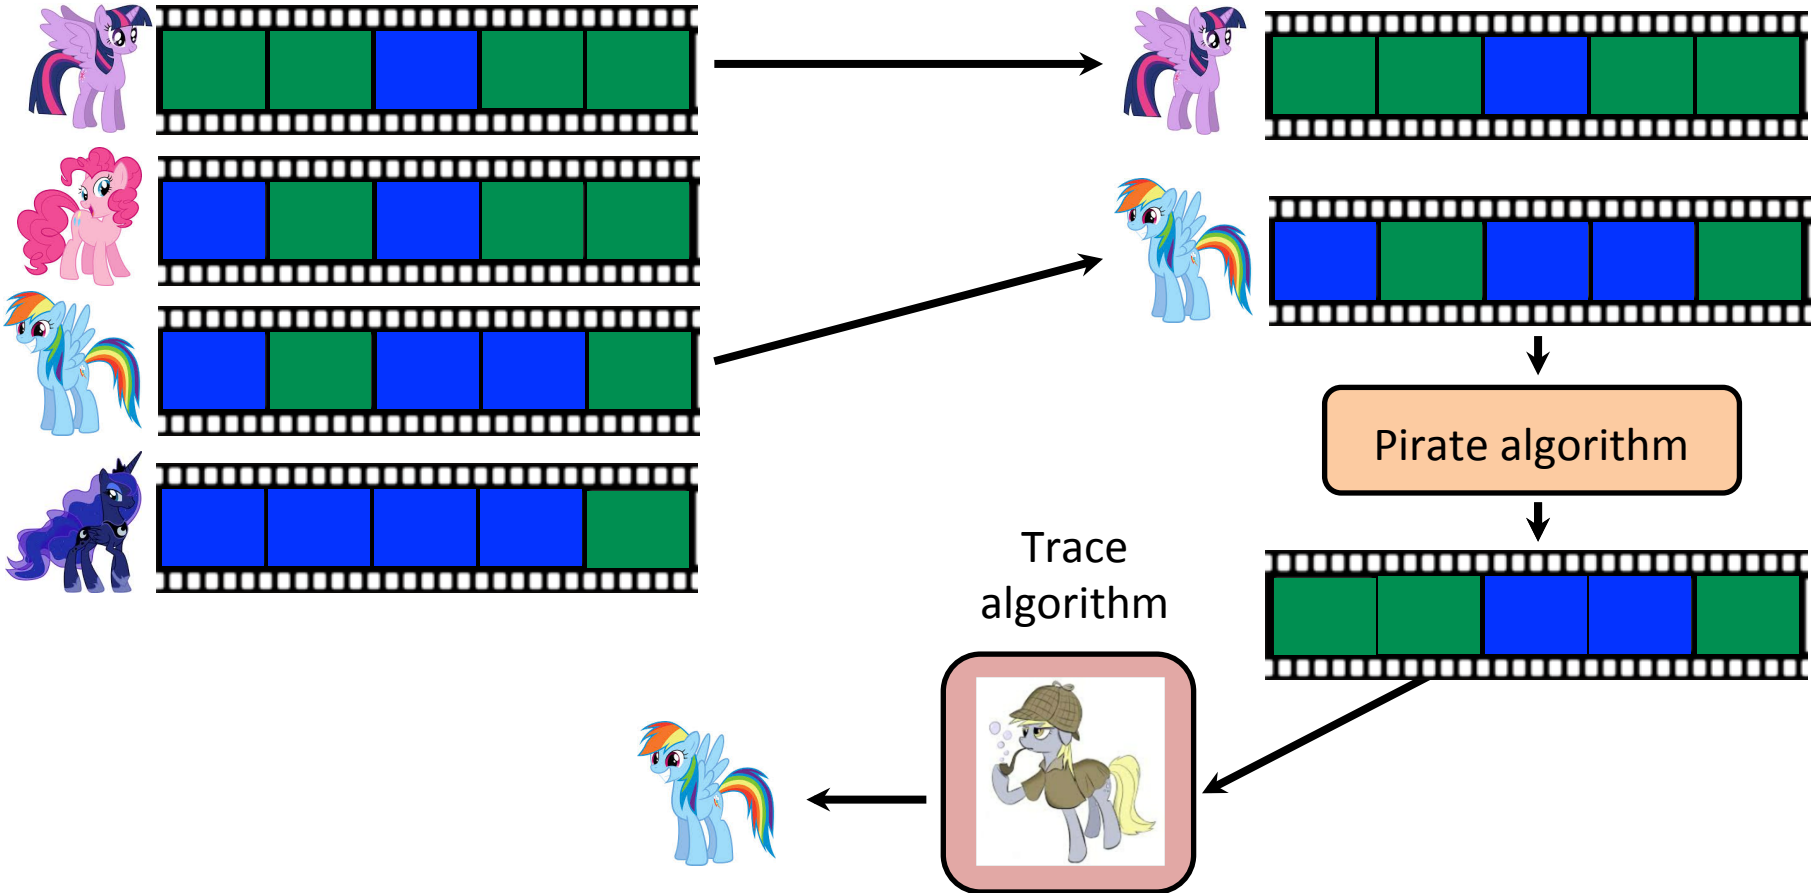

...but Equestria is full of pirates!

Who collude against me!

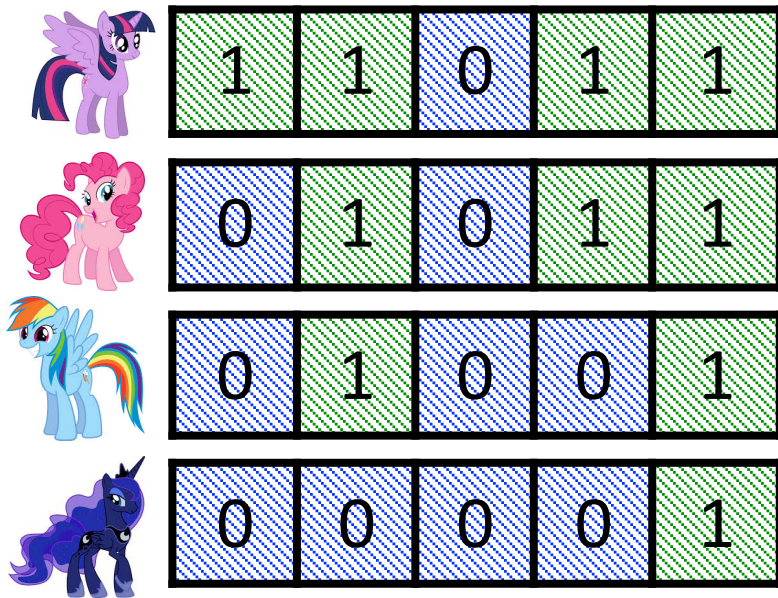

# Fingerprinting Codes [Boneh-Shaw95]

# Fingerprinting Codes [Boneh-Shaw95]

Gen( $1^n$ ) outputs  $W \in (\{0,1\}^k)^n$

Pirate coalition  $T \subseteq [n]$

Pirate algorithm

Feasible pirate codeword  $w$

Trace algorithm

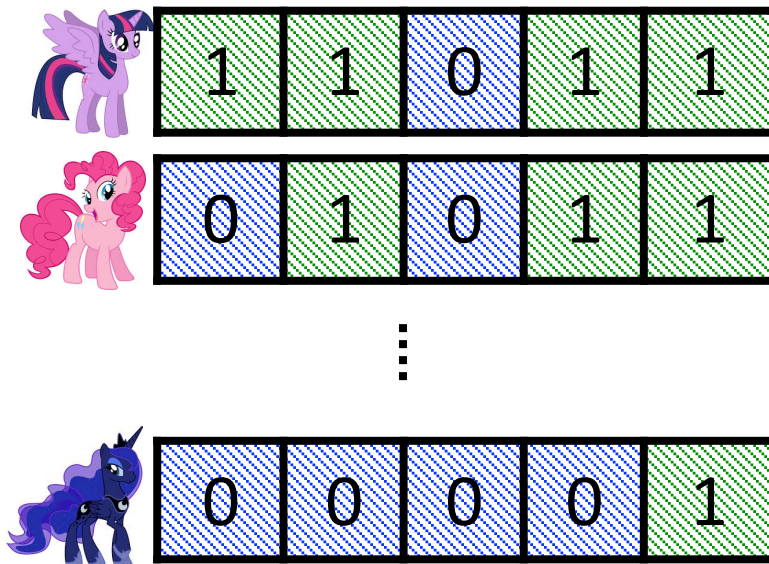

For all coalitions  $T$  and all pirate alg. for producing  $w$ ,

$$\Pr[\text{Trace}(w) \in T] \approx 1$$

# FP Codes vs. Diff. Privacy [B.-Ullman-Vadhan14]

Coalition of n pirates

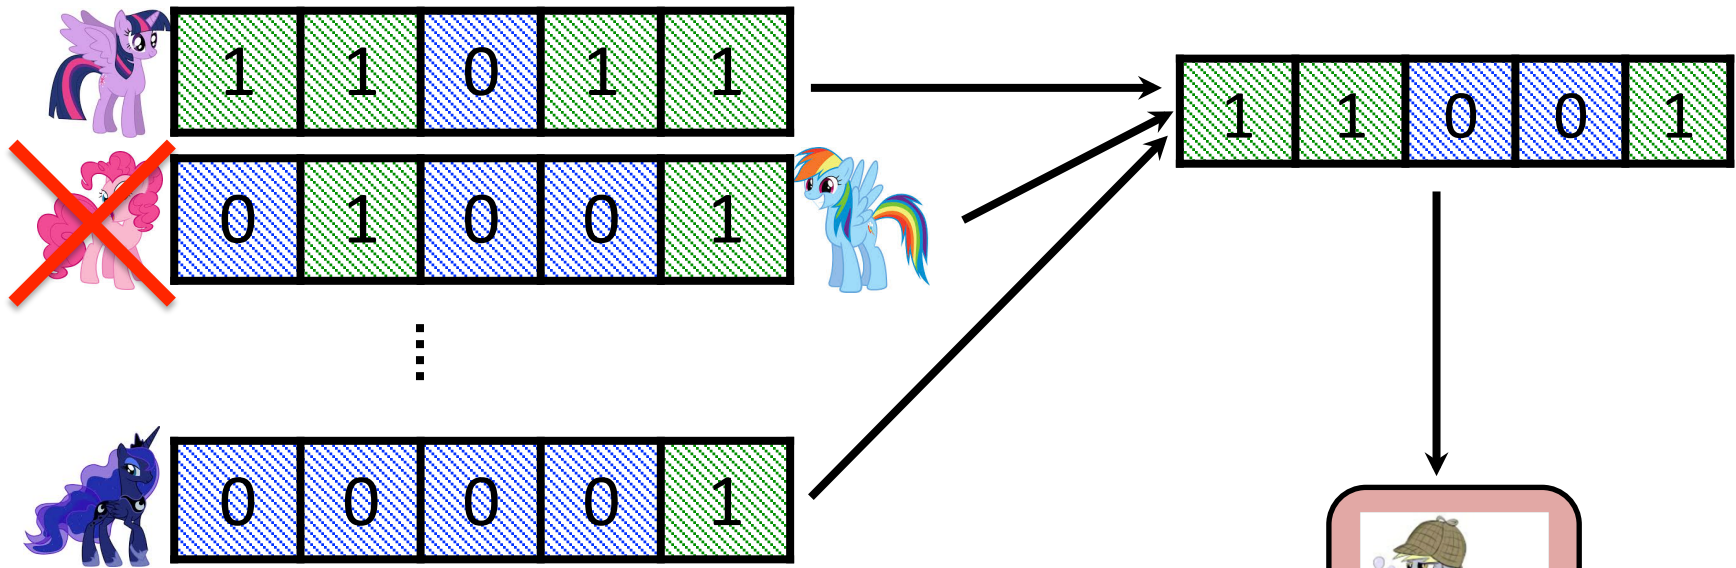

Feasible codeword w

$$\Pr[\text{Trace}(w) = \text{Pink Pony}] \geq 1/n$$

# FP Codes vs. Diff. Privacy [B.-Ullman-Vadhan14]

Coalition of n pirates

$$\Pr[\text{Trace}(w) = \text{Pinkie Pie}] \ll 1/n$$

# FP Codes vs. Diff. Privacy [B.-Ullman-Vadhan14]

Trace behaves very differently depending on whether  is in the coalition

Fingerprinting codes are the “opposite” of differential privacy!

# Lower Bound for Thresholds

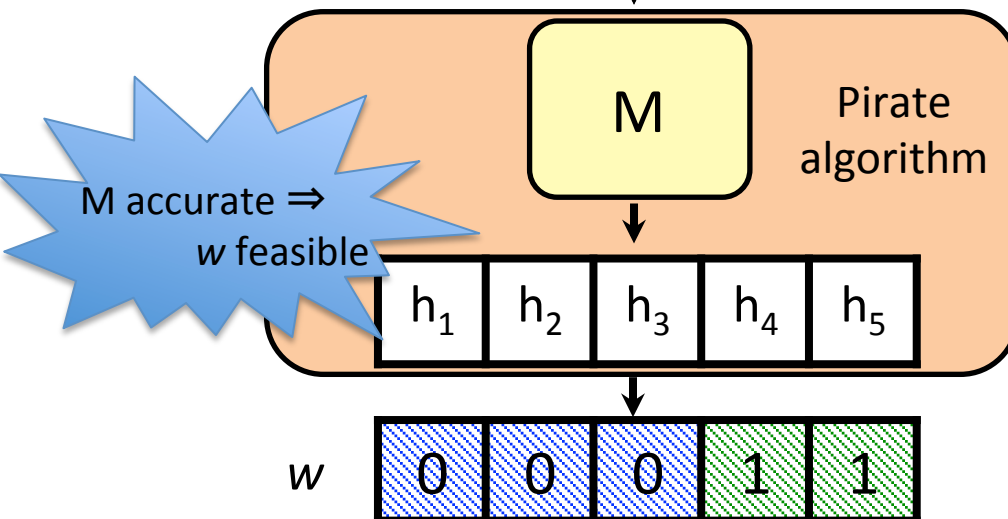

Labeled sample of  $n$  users = coalition of  $n$  users

	$c_1$	$c_2$	$c_3$	$c_4$	$c_5$
 $x_1$	1	1	0	1	1
 $x_2$	0	1	0	1	1
$\vdots$					
 $x_n$	0	0	0	0	1

Suppose (for contradiction) we have

- A FP code of length  $k$  for  $(n+1)$  users
- A diff. private  $M$  that learns  $k$  threshold functions

Reduction: Use  $M$  to break security of the FP code

# Lower Bound for Thresholds

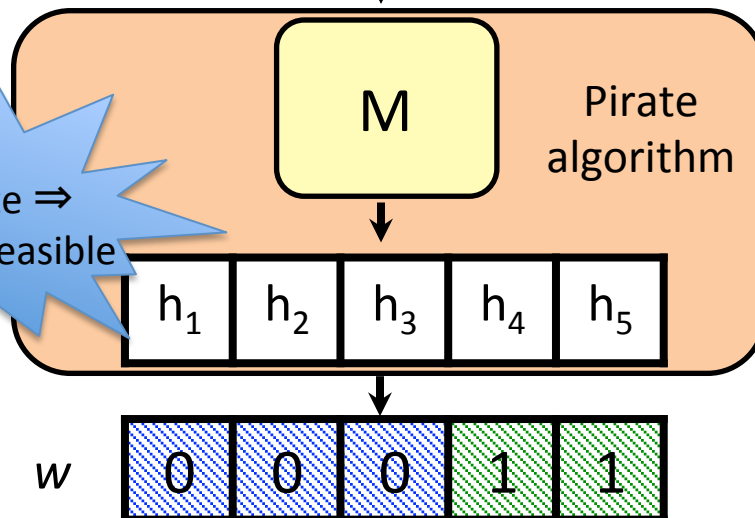

Labeled sample of  $n$  users = coalition of  $n$  users

How do we ensure  $M$  is accurate?

Each column of the codebook needs to be consistent with a threshold concept

$M$  accurate  $\Rightarrow$   
 $w$  feasible

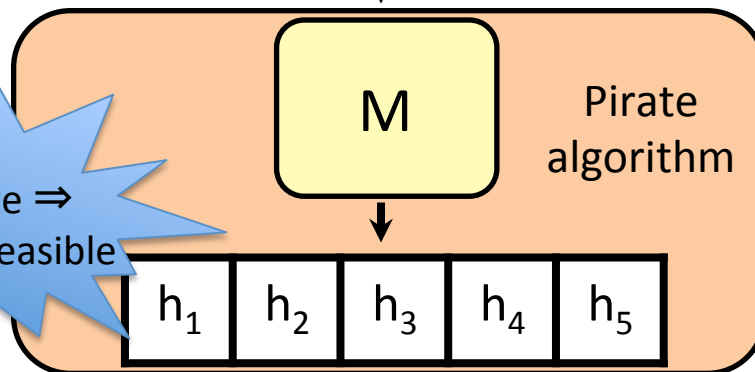

**Magic observation:**  
The FP code of [BS95] has this structure

# Lower Bound for Thresholds

Labeled sample of  $n$  users = coalition of  $n$  users

	$C_1$	$C_2$	$C_3$	$C_4$	$C_5$
 $x_1$	1	1	0	1	1
 $x_2$	0	1	0	1	1
$\vdots$					
 $x_n$	0	0	0	0	1

$w$	0	0	0	1	1
-----	---	---	---	---	---

Suppose (for contradiction) we have

- A **nice** FP code of length  $k$  for  $(n+1)$  users
- A diff. private  $M$  that learns  $k$  threshold functions

Reduction: Use  $M$  to break security of the FP code

$$w_j = \text{round} \left( \frac{1}{n} \sum_{i=1}^n h_j(x_i) \right)$$

M accurate  $\Rightarrow$   
w feasible

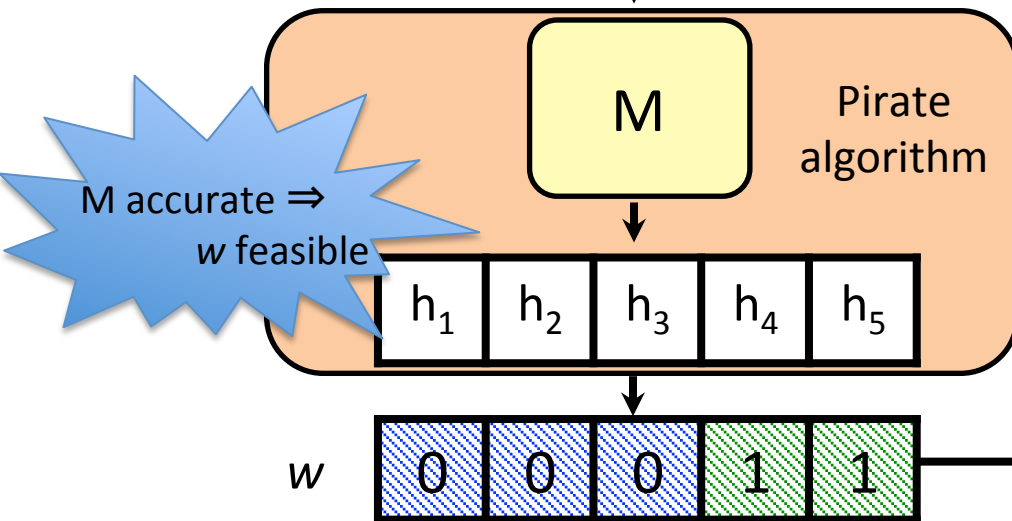

# Lower Bound for Thresholds

Labeled sample of  $n$  users = coalition of  $n$  users

	$c_1$	$c_2$	$c_3$	$c_4$	$c_5$
 $x_1$	1	1	0	1	1
 $x_2$	0	1	0	1	1
$\vdots$					
 $x_n$	0	0	0	0	1

$$\Pr[\text{Trace}(w) = \text{Pinkie Pie}] \geq 1/n$$

# Lower Bound for Thresholds

Labeled sample of  $n$  users = coalition of  $n$  users

Contradicts security of FP code!

$$\Pr[\text{Trace}(w) = \text{Pinkie Pie}] \geq \frac{(1/n) - \delta}{1 + \epsilon}$$

$\geq \frac{1}{3n}$

M private  $\Rightarrow$  Trace fails

M accurate  $\Rightarrow$  w feasible

# Lower Bound for Thresholds

- $\exists$  “nice” FP code for  $n$  users with length  $k$   
 $\Rightarrow$  learning  $k$  thresholds requires  $n$  samples
- [BS95]  $\exists$  “nice” FP code for  $\Omega(k^{1/3})$  users of length  $k$   
 $\therefore$  learning  $k$  thresholds requires  $n \geq \Omega(k^{1/3})$

# Conclusions

- Introduce study of private multi-learning
- Paint a complex picture of how sample complexity depends on  $k$

Thank you!

- Open questions
  - Is dependence on  $\text{poly}(k)\text{VC}(\mathcal{C})$  necessary?
  - Other examples of “direct-sum” tasks?

# Generic Multi-Learner

- Apply technique from [Beimel-Nissim-Stemmer15] for reducing labeled sample complexity
- Idea: 1. Identify set  $H$  of  $2^{VC(\mathcal{C})}$  “important” concepts via sanitization  
2. Run [KLNRS08] generic learner  $k$  times using  $H$  as hypothesis class
- Total sample complexity =  
fixed cost of sanitization +  $k^{1/2} VC(\mathcal{C})$
