### Lecture 22:

NP-completeness

Reading:

Sipser Ch 7.4-7.5

Mark Bun November 30, 2021

# Last time: Two equivalent definitions of NP

1) NP is the class of languages decidable in polynomial time on a nondeterministic TM

$$NP = \bigcup_{k=1}^{\infty} NTIME(n^k)$$

2) A polynomial-time verifier for a language L is a deterministic poly(|w|)-time algorithm V such that  $w \in L \iff$  there exists a certificate c such that  $V(\langle w,c \rangle)$  accepts

Theorem: A language  $L \in NP$  iff there is a polynomial-time verifier for L

# Examples of NP languages

Hamiltonian path

Given a graph G and vertices S, t, does G contain a Hamiltonian path from S to t?

Clique

Given a graph G and natural number k, does G contain a clique of size k?

- Subset Sum NTM: 6445 a subset  $S \subseteq \S1,...,43$ . (leck that  $\Xi_{i}^{l} x_{i}$  Given a list of natural numbers  $x_{1},...,x_{k},t$  is there a subset of the numbers  $x_{1},...,x_{k}$  that sum up to exactly t?
- Boolean satisfiability (SAT)
   Given a Boolean formula, is there a satisfying assignment?
- Vertex Cover

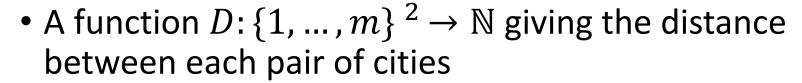

Given a graph G and natural number k, does G contain a vertex cover of size k?

# Examples of NP languages: Traveling Salesperson

"Given a list of cities and distances between them, is there a 'short' tour of all of the cities?"

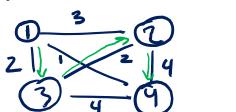

# More precisely: Given

A number of cities m

A distance bound B

$$TSP = \{\langle m, D, B \rangle | \exists \text{ a tour visiting every city}$$
  
with length  $\leq B \}$ 

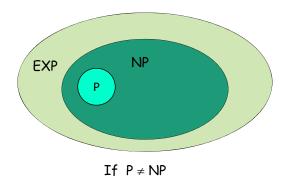

B= 8

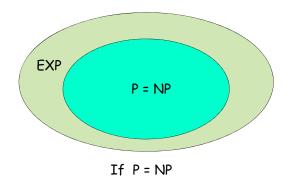

# P vs. NP

Question: Does P = NP?

Philosophically: Can every problem with an efficiently verifiable solution also be solved efficiently?

A central problem in mathematics and computer science

### Millennium Problems

### Yang-Mills and Mass Gap

Experiment and computer simulations suggest the existence of a "mass gap" in the solution to the quantum versions of the Yang-Mills equations. But no proof of this property is known.

### Riemann Hypothesis

The prime number theorem determines the average distribution of the primes. The Riemann hypothesis tells us about the deviation from the average. Formulated in Riemann's 1859 paper, it asserts that all the 'non-obvious' zeros of the zeta function are complex numbers with real part 1/2.

#### P vs NP Problem

If it is easy to check that a solution to a problem is correct, is it also easy to solve the problem? This is the essence of the PVs NP question. Typical of the NP problems is that of the Hamiltonian Path Problem given N clies to visit, how can one do this without visiting a city twice? If you give me a solution, I can easily phete that it is correct. But I cannot use easily find a solution.

#### Navier-Stokes Equation

This is the equation which governs the flow of fluids such as water and air. However, there is no proof for the most basic questions one can ask: do solutions exist, and are they unique? Why ask for a proof? Because a proof gives not only certitude, but also understanding.

### Hodge Conjecture

The answer to this conjecture determines how much of the topology of the solution set of a system of algebraic equations can be defined in terms of further algebraic equations. The Hodge conjecture is known in certain special cases, e.g., when the solution set has dimension less than four. But in dimension four it is unknown.

### Poincaré Conjecture

In 1904 the French mathematician Henri Poincaré asked if the three dimensional sphere is characterized as the unique simply connected three manifold. This question, the Poincaré Conjecture, was a special case of Thurston's geometrization conjecture. Perelman's proof tells us that every three manifold is built from a set of standard pieces, each with one of leish twell-understood geometries.

### Birch and Swinnerton-Dyer Conjecture

Supported by much experimental evidence, this conjecture relates the number of points on an elliptic curve mod p to the rank of the group of rational points. Elliptic curves, defined by cubic equations in two variables, are fundamental mathematical objects that arise in many areas: Wiles proof of the Fernat Conjecture, factorization of numbers into primas, and cryptography; to name three.

# A world where P = NP

 Many important decision problems can be solved in polynomial time (HAMPATH, SAT, TSP, etc.)

 Many search problems can be solved in polynomial time (e.g., given a natural number, find a prime factorization)

 Many optimization problems can be solved in polynomial time (e.g., find the lowest energy conformation of a protein)

### A world where P = NP

Secure cryptography becomes impossible

An NP search problem: Given a ciphertext c, find a plaintext m and encryption key k that would encrypt to c

- AI / machine learning become easy: Identifying a consistent classification rule is an NP search problem
- Finding mathematical proofs becomes easy: NP search problem: Given a mathematical statement S and length bound k, is there a proof of S with length at most k?

General consensus: 
$$P \neq NP$$
 $NQP \not= Acc^{\circ}$ 
 $NQP \not= Acc^{\circ}$ 
 $NQP \not= Acc^{\circ}$ 
 $NQP \not= Acc^{\circ}$ 
 $NQP \not= Acc^{\circ}$ 

# NP-Completeness

# Understanding the P vs. NP question

Most believe  $P \neq NP$ , but we are very far from proving it

Question 1: How can studying specific computational problems help us get a handle on resolving P vs. NP?

Question 2: What would  $P \neq NP$  allow us to conclude about specific problems we care about?

Idea: Identify the "hardest" problems in NP

Languages  $L \in NP$  such that  $L \in P$  iff P = NP

# Recall: Mapping reducibility

### **Definition:**

A function  $f: \Sigma^* \to \Sigma^*$  is computable if there is a TM M which, given as input any  $w \in \Sigma^*$ , halts with only f(w) on its tape.

**Definition:** 

Language A is mapping reducible to language B, written  $A \leq_m B$ 

if there is a computable function  $f: \Sigma^* \to \Sigma^*$  such that for all strings  $w \in \Sigma^*$ , we have  $w \in A \iff f(w) \in B$ 

# Polynomial-time reducibility

### **Definition:**

A function  $f: \Sigma^* \to \Sigma^*$  is polynomial-time computable if there is a polynomial-time TM M which, given as input any  $w \in \Sigma^*$ , halts with only f(w) on its tape.

### **Definition:**

Language A is polynomial-time reducible to language B, written

$$A \leq_{\mathbf{p}} B$$

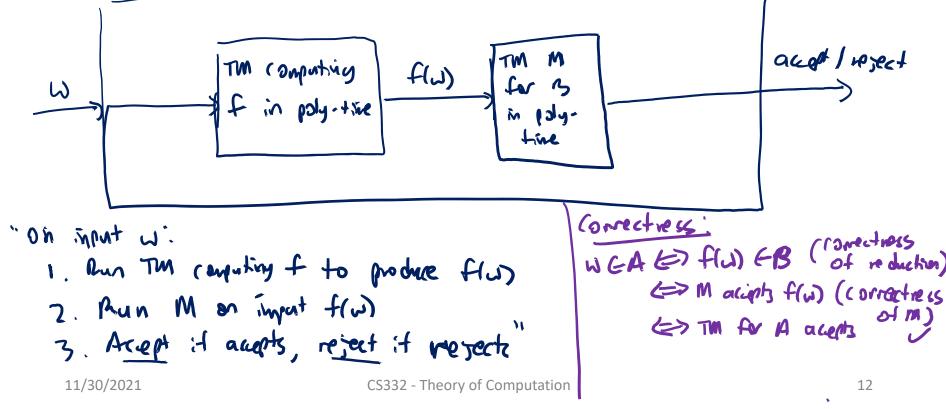

if there is a polynomial-time computable function  $f: \Sigma^* \to \Sigma^*$  such that for all strings  $w \in \Sigma^*$ , we have  $w \in A \iff f(w) \in B$ 

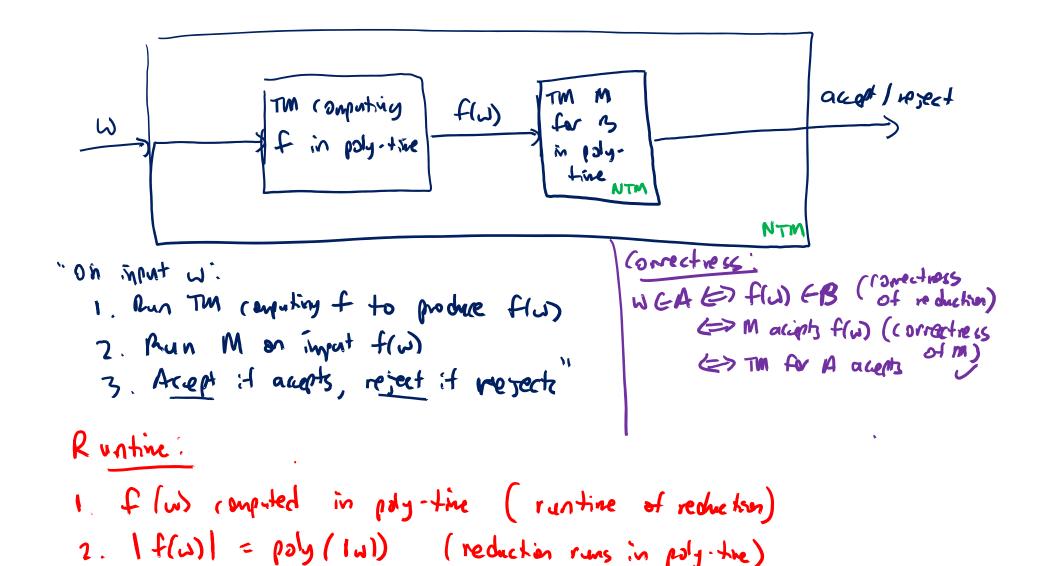

# Implications of poly-time reducibility

Theorem: If  $A \leq_p B$  and  $B \in P$ , then  $A \in P$ 

Proof: Let M decide B in poly time, and let f be a polytime reduction from A to B. The following TM decides A

in poly <u>time:</u>

of pla takes poly (IUI) time (sine poly is

# Is NP closed under poly-time reductions?

If  $A \leq_p B$  and B is in NP, does that mean A is also in NP? P decidable P NP recognizable

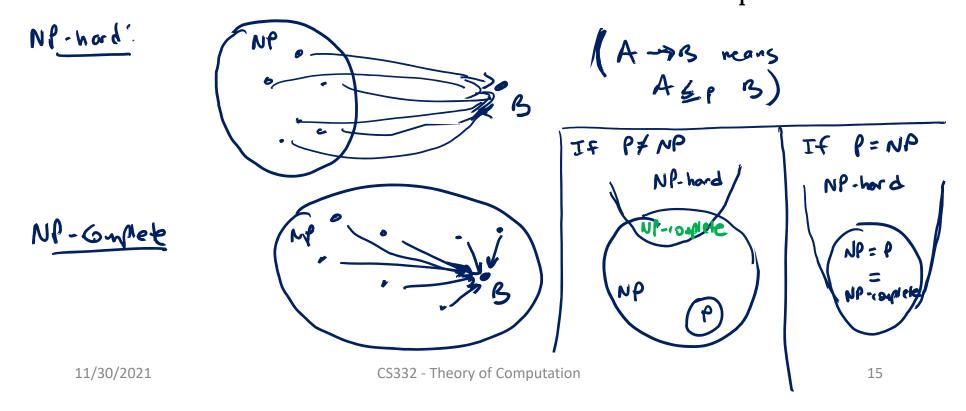

- a) Yes, the same proof works using NTMs instead of TMs
  - b) No, because the new machine is an NTM instead of a deterministic TM
  - c) No, because the new NTM may not run in polynomial time
  - d) No, because the new NTM may accept some inputs it should reject
  - e) No, because the new NTM may reject some inputs it should accept

# NP-completeness

Definition: A language B is NP-complete if

- 1)  $B \in NP$ , and
- 2) B is NP-hard: Every language  $A \in NP$  is poly-time reducible to B, i.e.,  $A \leq_{p} B$

# Implications of NP-completeness

Theorem: Suppose *B* is NP-complete.

Then 
$$B \in P$$
 iff  $P = NP$ 

### **Proof:**

# Implications of NP-completeness

Theorem: Suppose *B* is NP-complete.

Then  $B \in P$  iff P = NP

Consequences of *B* being NP-complete:

- 1) If you want to prove P = NP, you just have to prove  $B \in P$
- 2) If you want to prove  $P \neq NP$ , you just have to prove  $B \notin P$
- 3) If you believe  $P \neq NP$ , then you also believe  $B \notin P$

# Cook-Levin Theorem and NP-Complete Problems

Do NP-complete problems exist?

Cf.  $A_{3m}$  is "RE "complete", i.e.  $A_{3m}$  is recognizable and Theorem:  $TMSAT = \{\langle N, w, 1^t \rangle \mid \forall vecagnizable L, le n A_{3m}$ 

NTM *N* accepts input *w* within *t* steps} is NP-complete

Proof sketch: 1)  $TMSAT \in NP$ : Certificate = tnondeterministic guesses made by N, verifier checks that N accepts w within t steps under those guesses. (  $\frac{1}{N_c}$  is used)

2) TMSAT is NP-hard: Let  $L \in NP$  be decided by NTM N running in time T(n). The following poly-time TM

shows  $L \leq_{p} TMSAT$ :

"On input w (an instance of L):

Output  $\langle N, w, 1^{T(|w|)} \rangle$ ."
