# Regular Expressions – Syntax

A regular expression  $R$  is defined recursively using the following rules:

1.  $\varepsilon$ ,  $\emptyset$ , and  $a$  are regular expressions for every  $a \in \Sigma$
2. If  $R_1$  and  $R_2$  are regular expressions, then so are  $(R_1 \cup R_2)$ ,  $(R_1 R_2)$ , and  $(R_1^*)$

Examples: (over  $\Sigma = \{a, b, c\}$ )

$ab$

$(ab^* \cup a^*b)^*$

$\emptyset^*$

# Regular Expressions – Semantics

$L(R)$  = the language a regular expression describes

1.  $L(\emptyset) = \emptyset$
2.  $L(\epsilon) = \{\epsilon\}$
3.  $L(a) = \{a\}$  for every  $a \in \Sigma$
4.  $L((R_1 \cup R_2)) = L(R_1) \cup L(R_2)$
5.  $L((R_1 R_2)) = L(R_1) \circ L(R_2)$
6.  $L((R_1^*)) = (L(R_1))^*$

**Example:**  $L(a^* b^*) = \{a^m b^n \mid m, n \geq 0\}$

# Regular Expressions Describe Regular Languages

**Theorem:** A language  $A$  is regular if and only if it is described by a regular expression

**Theorem 1:** Every regular expression has an equivalent NFA

**Theorem 2:** Every NFA has an equivalent regular expression

# NFA $\rightarrow$ Regular expression

**Theorem 2:** Every NFA has an equivalent regex

Proof idea: Simplify NFA by “ripping out” states one at a time and replacing with regexes

# Generalized NFAs

- **Every transition is labeled by a regex**
- One start state with only outgoing transitions
- Only one accept state with only incoming transitions
- Start state and accept state are distinct

# Generalized NFA Example

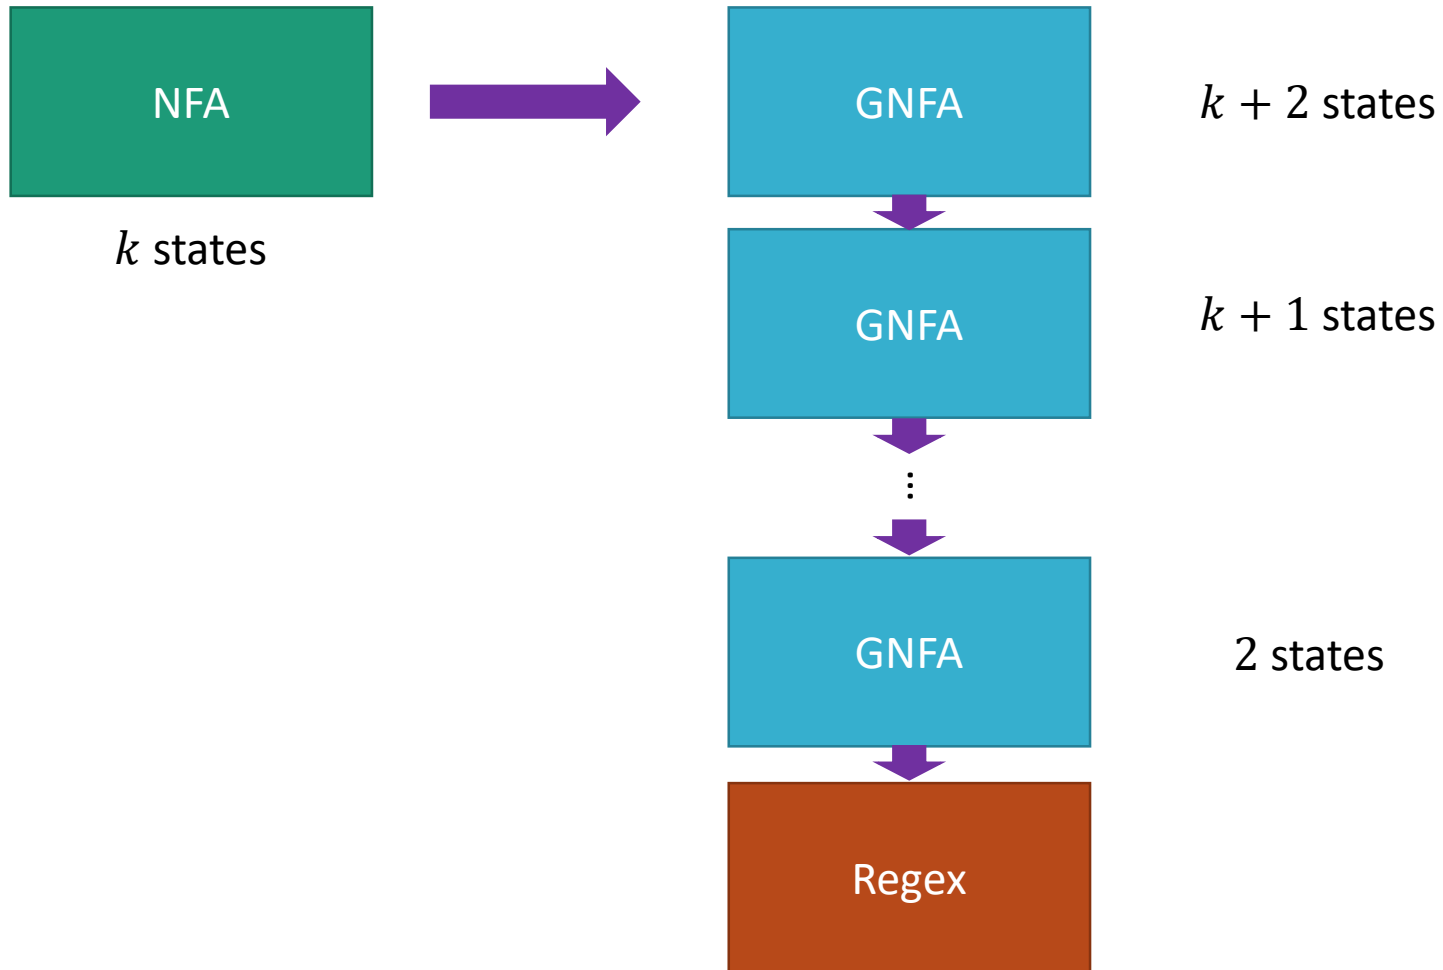

$$R(q_s, q) =$$

$$R(q_a, q) =$$

$$R(q, q_s) =$$

# NFA $\rightarrow$ Regular expression

# NFA $\rightarrow$ GNFA

- Add a new start state with no incoming arrows.
- Make a unique accept state with no outgoing arrows.

# GNFA $\rightarrow$ Regular expression

**Idea:** While the machine has more than 2 states, rip one out and relabel the arrows with regexes to account for the missing state

# GNFA $\rightarrow$ Regular expression

**Idea:** While the machine has more than 2 states, rip one out and relabel the arrows with regexes to account for the missing state

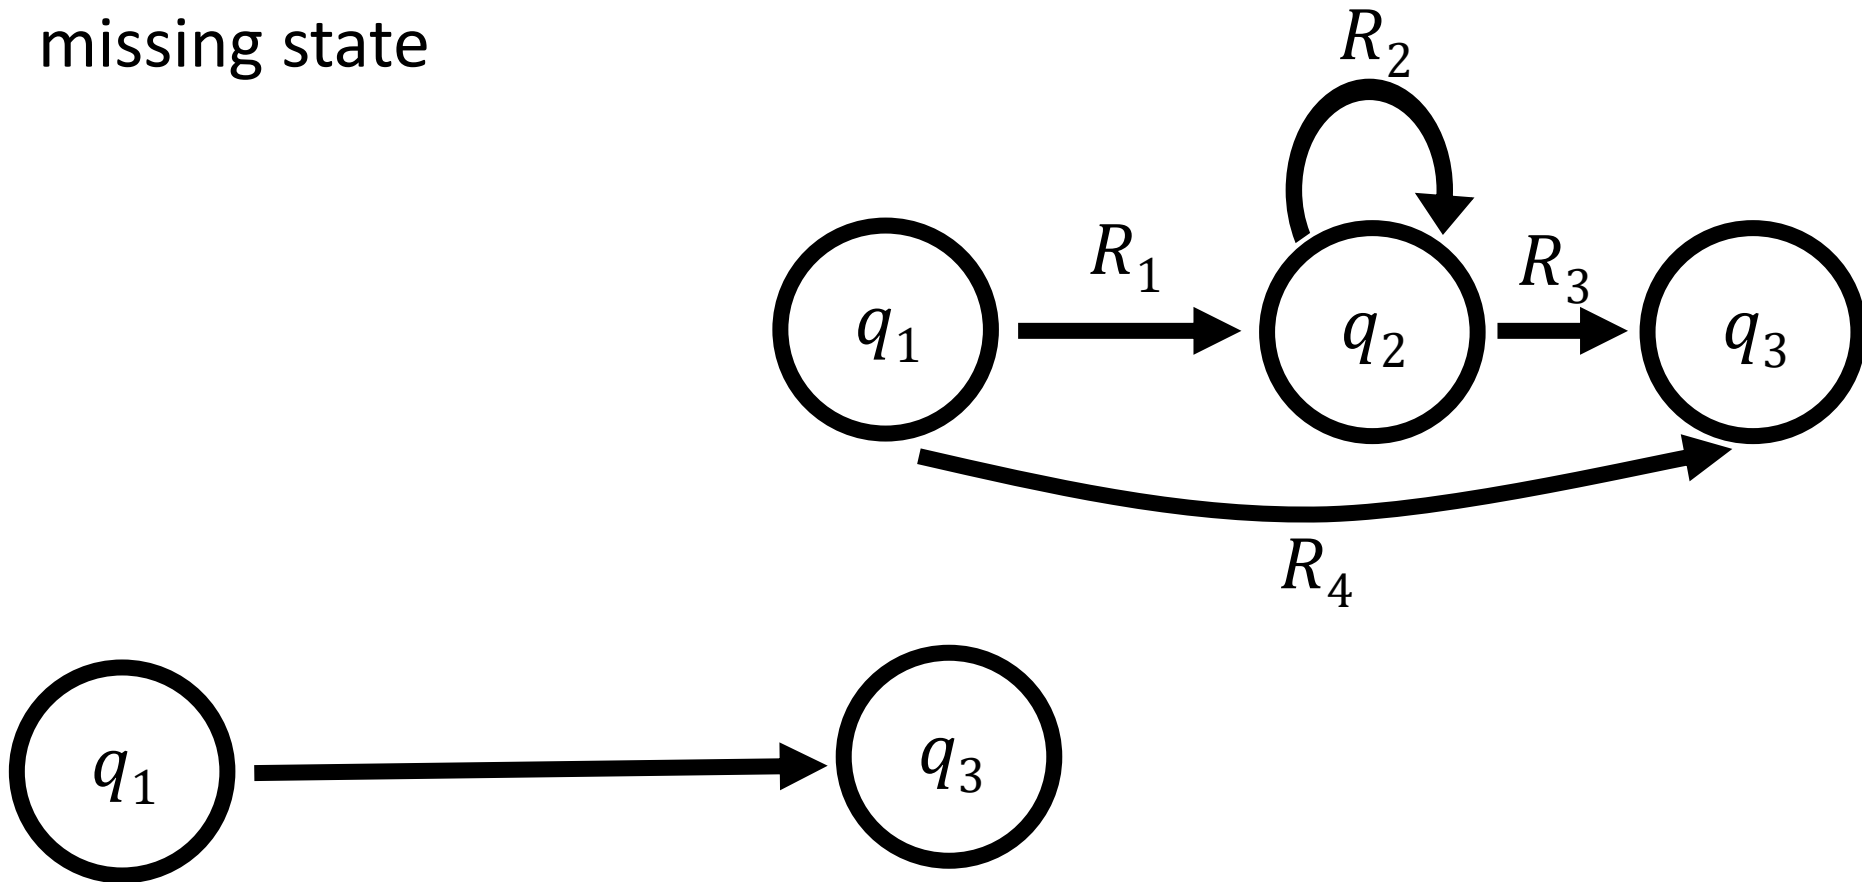

# GNFA $\rightarrow$ Regular expression

**Idea:** While the machine has more than 2 states, rip one out and relabel the arrows with regexes to account for the missing state

# GNFA $\rightarrow$ Regular expression

**Idea:** While the machine has more than 2 states, rip one out and relabel the arrows with regexes to account for the missing state

# Example

# Context-Free Grammars

# Some History

## An abstract model for two distinct problems

## Rules for parsing natural languages

### THREE MODELS FOR THE DESCRIPTION OF LANGUAGE\*

Noam Chomsky

Massachusetts Institute of Technology  
Cambridge, Massachusetts

#### Abstract

We investigate several conceptions of linguistic structure to determine whether or not they can provide simple and "revealing" grammars that generate all of the sentences of English and only these. We find that no finite-state Markov process that produces symbols with transition from state to state can serve as an English grammar. Furthermore, the particular subclass of such processes that produce n-order statistical approximations to

observations, to show how they are interrelated, and to predict an indefinite number of new phenomena. A mathematical theory has the additional property that predictions follow rigorously from the body of theory. Similarly, a grammar is based on a finite number of observed sentences (the linguist's corpus) and it "projects" this set to an infinite set of grammatical sentences by establishing general "laws" (grammatical rules) framed in terms of

# Some History

## An abstract model for two distinct problems

### Specification of syntax and compilation for programming languages

1977 ACM Turing Award citation  
(John Backus)

For profound, influential, and lasting contributions to the design of practical high-level programming systems, notably through his work on FORTRAN, and for seminal publication of formal procedures for the specification of programming languages.

# Context-Free Grammar (Informal)

## Example Grammar $G$

$A \rightarrow 0A1$

$A \rightarrow B$

$B \rightarrow \#$

Derivation

$L(G) =$

# Context-Free Grammar (Informal)

## Example Grammar $G$

$$E \rightarrow E + T$$

$$E \rightarrow T$$

$$T \rightarrow T \times F$$

$$T \rightarrow F$$

$$F \rightarrow (E)$$

$$F \rightarrow a$$

$$F \rightarrow b$$

## Derivation

$$L(G) =$$

# Socially Awkward Professor Grammar

<PHRASE>  $\rightarrow$  <FILLER><PHRASE>

<PHRASE>  $\rightarrow$  <START><END>

<FILLER>  $\rightarrow$  LIKE

<FILLER>  $\rightarrow$  UMM

<START>  $\rightarrow$  YOU KNOW

<START>  $\rightarrow \epsilon$

<END>  $\rightarrow$  WHOOPS

<END>  $\rightarrow$  SORRY

<END>  $\rightarrow$  \$#@!

# Socially Awkward Professor Grammar

$\langle \text{PHRASE} \rangle \rightarrow \langle \text{FILLER} \rangle \langle \text{PHRASE} \rangle \mid \langle \text{START} \rangle \langle \text{END} \rangle$

$\langle \text{FILLER} \rangle \rightarrow \text{LIKE} \mid \text{UMM}$

$\langle \text{START} \rangle \rightarrow \text{YOU KNOW} \mid \epsilon$

$\langle \text{END} \rangle \rightarrow \text{WHOOOPS} \mid \text{SORRY} \mid \$\#\@!$

# Context-Free Grammar (Formal)

A CFG is a 4-tuple  $G = (V, \Sigma, R, S)$

- $V$  is a finite set of variables
- $\Sigma$  is a finite set of terminal symbols (disjoint from  $V$ )
- $R$  is a finite set of production rules of the form  $A \rightarrow w$ , where  $A \in V$  and  $w \in (V \cup \Sigma)^*$
- $S \in V$  is the start symbol

Example:  $G = (\{S\}, \Sigma, R, S)$  where  $R = \{S \rightarrow aSb, S \rightarrow \varepsilon\}$

# Context-Free Grammar (Formal)

A CFG is a 4-tuple  $G = (V, \Sigma, R, S)$

$V$  = variables       $\Sigma$  = terminals       $R$  = rules       $S$  = start

- We say  $uAv \Rightarrow uwv$  (“ $uAv$  yields  $uwv$ ”) if  $A \rightarrow w$  is a rule of the grammar
- We say  $u \xRightarrow{*} v$  (“ $u$  derives  $v$ ”) if  $u = v$  or there exists a sequence such that  $u \Rightarrow u_1 \Rightarrow u_2 \Rightarrow \dots \Rightarrow v$
- Language of the grammar:  $L(G) = \{w \in \Sigma^* \mid S \xRightarrow{*} w\}$

Example:  $G = (\{S\}, \Sigma, R, S)$  where  $R = \{S \rightarrow aSb, S \rightarrow \varepsilon\}$   
 $L(G) = \{a^n b^n \mid n \geq 0\}$

# CFG Examples

Give context-free grammars for the following languages

1. The empty language
2. Strings of properly nested parentheses
3. Strings with equal # of  $a$ 's and  $b$ 's

# Pumping Lemma II: Pump Harder

# Non context-free languages?

- Could it be the case that every language is context-free?

# Pumping Lemma for regular languages

Let  $L$  be a regular language.

Then there exists a “pumping length”  $p$  such that

For every  $w \in L$  where  $|w| \geq p$ ,

$w$  can be split into three parts  $w = xyz$  where:

1.  $|y| > 0$
2.  $|xy| \leq p$
3.  $xy^iz \in L$  for all  $i \geq 0$

# Pumping Lemma for context-free languages

Let  $L$  be a context-free language.

Then there exists a “pumping length”  $p$  such that

For every  $w \in L$  where  $|w| \geq p$ ,

$w$  can be split into five parts  $w = uvxyz$  where:

1.  $|vy| > 0$
2.  $|vxy| \leq p$
3.  $uv^i xy^i z \in L$  for all  $i \geq 0$

Example:

$$L = \{w \in \{0, 1\}^* \mid w = w^R\}$$
$$w = 0$$

# Pumping Lemma for context-free languages

Let  $L$  be a context-free language.

Then there exists a “pumping length”  $p$  such that

For every  $w \in L$  where  $|w| \geq p$ ,

$w$  can be split into five parts  $w = uvxyz$  where:

1.  $|vy| > 0$

2.  $|vxy| \leq p$

3.  $uv^i xy^i z \in L$  for all  $i \geq 0$

Example:

$$L = \{w \in \{0, 1\}^* \mid w = w^R\}$$
$$w = 010$$

# Pumping Lemma as a game

1. **YOU** pick the language  $L$  to be proved non context-free.
2. **ADVERSARY** picks a possible pumping length  $p$ .
3. **YOU** pick  $w$  of length at least  $p$ .
4. **ADVERSARY** divides  $w$  into  $u, v, x, y, z$ , obeying rules of the Pumping Lemma:  $|vy| > 0$  and  $|vxy| \leq p$ .
5. **YOU** win by finding  $i \geq 0$ , for which  $uv^i xy^i z$  is not in  $L$ .

If *regardless* of how the **ADVERSARY** plays this game, you can always win, then  $L$  is non context-free

# Pumping Lemma example

Claim:  $L = \{a^n b^n c^n \mid n \geq 0\}$  is not regular

Proof: Assume  $L$  is regular with pumping length  $p$

1. Find  $w \in L$  with  $|w| \geq p$
2. Show that  $w$  cannot be pumped  
If  $w = uvxyz$  with  $|vy| > 0, |vxy| \leq p$ , then...

# Pumping Lemma example
