

BU CS 332 – Theory of Computation

Lecture 13:

- Mid-Semester Feedback
- Enumerators
- Decidable Languages
- Countability

Reading:

Sipser Ch 4.1

Mark Bun

March 16, 2020

What aspects of the course help you learn best?

- Examples in class
- Reviewing past homeworks/exams in class
- Textbook
- Posting materials online
- Lecture, generally
- Office hours
- In-depth problem-solving in discussion section
- Top Hat questions
- Piazza discussions / instructor response

What in the class so far has hindered your learning?

- Pace of information transmission / workload
- Criteria for formality of proofs on homework and exams
- Poor handwriting
- Questions in class not fully answered
- Lack of organization in discussion
- Broad concepts

- “Bureaucratic descriptions”
- “All materials concluded”

What specific changes can we make to improve your learning?

- More examples
- Post solutions / other materials online
- Discussion solutions
- More Top Hat questions
- Go slower
- More guidelines for how to solve each type of problem
- Looser grading
- Midterm too long
- More detailed slides

Do you understand what is expected from you in this class?

- Reading the book before vs. after class
- Need to do every problem in the book to succeed?
- Lack of coordination between readings and lectures
- “I have to attend lectures, read the material in the book, do some practice problems and then attempt the homework”
- Exam grading critical over formatting vs. looser standards on homework

How can you improve your own learning?

- Read the book
- Solve more practice problems
- Review HW solutions
- Come to office hours
- Time management
- Open mind to more abstract ways of thinking

Enumerators

TMs are equivalent to...

- TMs with “stay put”
- TMs with 2-way infinite tapes
- Multi-tape TMs
- Nondeterministic TMs
- Random access TMs
- Enumerators
- Finite automata with access to an unbounded queue = 2-stack PDAs
- Primitive recursive functions
- Cellular automata
- “Turing-complete” programming languages (C, Python, Java...)

...

Enumerators

- Starts with two blank tapes
- Prints strings to printer

$$L(E) = \{\text{strings eventually printed by } E\}$$

- May never terminate (even if language is finite)
- May print the same string many times

Enumerator Example

1. Initialize $c = 1$
2. Repeat forever:
 - Calculate $s = c^2$ (in binary)
 - Send s to printer
 - Increment c

What language does this enumerator enumerate?

Enumerable = Turing-Recognizable

Theorem: A language is Turing-recognizable \Leftrightarrow some enumerator enumerates it

\Leftarrow Start with an enumerator E for A and give a TM

Enumerable = Turing-Recognizable

Theorem: A language is Turing-recognizable \Leftrightarrow some enumerator enumerates it

\Rightarrow Start with a TM M for A and give an enumerator

Decidable Languages

1928 – The *Entscheidungsproblem*

The “Decision Problem”

Is there an algorithm which takes as input a formula (in first-order logic) and decides whether it’s logically valid?

Questions about regular languages

Design a TM which takes as input a DFA D and a string w , and determines whether D accepts w

How should the input to this TM be represented?

Let $D = (Q, \Sigma, \delta, q_0, F)$. List each component of the tuple separated by ;

- Represent Q by ,-separated binary strings
- Represent Σ by ,-separated binary strings
- Represent $\delta : Q \times \Sigma \rightarrow Q$ by a ,-separated list of triples $(p, a, q), \dots$

Denote the **encoding** of D, w by $\langle D, w \rangle$

Representation independence

Computability (i.e., decidability and recognizability) is not affected by the choice of encoding

Why? A TM can always convert between different encodings

For now, we can take $\langle \ \ \rangle$ to mean “any reasonable encoding”

A “universal” algorithm for recognizing regular languages

$$A_{\text{DFA}} = \{\langle D, w \rangle \mid \text{DFA } D \text{ accepts } w\}$$

Theorem: A_{DFA} is decidable

Proof: Define a 3-tape TM M on input $\langle D, w \rangle$:

1. Check if $\langle D, w \rangle$ is a valid encoding (reject if not)
2. Simulate D on w , i.e.,
 - Tape 2: Maintain w and head location of D
 - Tape 3: Maintain state of D , update according to δ
3. Accept iff D ends in an accept state

Other decidable languages

$$A_{\text{DFA}} = \{\langle D, w \rangle \mid \text{DFA } D \text{ accepts } w\}$$

$$A_{\text{NFA}} = \{\langle N, w \rangle \mid \text{NFA } N \text{ accepts } w\}$$

$$A_{\text{REG}} = \{\langle R, w \rangle \mid \text{regular expression } R \text{ generates } w\}$$

$$A_{\text{CFG}} = \{\langle G, w \rangle \mid \text{CFG } G \text{ generates } w\}$$

CFG Generation

Theorem: $A_{\text{CFG}} = \{\langle G, w \rangle \mid \text{CFG } G \text{ generates } w\}$ is Turing-recognizable

Proof idea: Define a TM M recognizing A_{CFG}

On input $\langle G, w \rangle$:

1. Enumerate all strings that can be generated from G
(i.e., all length-1 derivations, all length-2 derivations, ...)
2. If any of these strings equal w , accept

CFG Generation

Theorem: $A_{\text{CFG}} = \{\langle G, w \rangle \mid \text{CFG } G \text{ generates } w\}$ is **decidable**

Chomsky Normal Form for CFGs:

- Can have a rule $S \rightarrow \varepsilon$
- All remaining rules of the form $A \rightarrow BC$ or $A \rightarrow a$
- Cannot have S on the RHS of any rule

Lemma: Any CFG can be converted into an equivalent CFG in Chomsky Normal Form

Lemma: If G is in Chomsky Normal Form, any nonempty string w that can be derived from G has a derivation with at most $2|w| - 1$ steps

CFG Generation

Theorem: $A_{\text{CFG}} = \{\langle G, w \rangle \mid \text{CFG } G \text{ generates } w\}$ is **decidable**

Proof idea: Define a TM M recognizing A_{CFG}

On input $\langle G, w \rangle$:

1. Convert G into Chomsky Normal Form
2. Enumerate all strings derivable in $\leq 2|w| - 1$ steps
3. If any of these strings equal w , accept

Context Free Languages are Decidable

Theorem: Every CFL L is decidable

Proof: Let G be a CFG generating L . The following TM decides L .

On input w :

1. Run the decider for A_{CFG} on input $\langle G, w \rangle$
2. Accept if the decider accepts; reject otherwise

Classes of Languages

More Examples

$E_{\text{DFA}} = \{\langle D \rangle \mid D \text{ is a DFA that recognizes the empty language}\}$

$E_{\text{CFG}} = \{\langle G \rangle \mid G \text{ is a CFG that recognizes the empty language}\}$

Decidability of E_{DFA}

Theorem: $E_{DFA} = \{\langle D \rangle \mid D \text{ is a DFA that recognizes } \emptyset\}$ is decidable

Proof: The following TM decides E_{DFA}

On input $\langle D \rangle$, where D is a DFA with n states:

1. Perform n steps of breadth-first search on state diagram of D to determine if an accept state is reachable from the start state
2. Accept if an accept state reachable; reject otherwise

Decidability of E_{CFG}

Theorem: $E_{CFG} = \{\langle G \rangle \mid G \text{ is a CFG that recognizes } \emptyset\}$ is decidable

Proof: The following TM decides E_{CFG}

On input $\langle G \rangle$, where G is a CFG with n states:

1. Mark all terminal symbols in G
2. Repeat until no new variable is marked:
Mark any variable A where G has a rule $A \rightarrow U_1 U_2 \dots U_k$ and every symbol U_1, \dots, U_k is marked
3. Accept if the start variable is unmarked; else reject

New Deciders from Old

$EQ_{\text{DFA}} = \{\langle D_1, D_2 \rangle \mid D_1, D_2 \text{ are DFAs and } L(D_1) = L(D_2)\}$

Theorem: EQ_{DFA} is decidable

Proof: The following TM decides EQ_{DFA}

On input $\langle D_1, D_2 \rangle$, where $\langle D_1, D_2 \rangle$ are DFAs:

1. Construct a DFA D that recognizes the **symmetric difference** $L(D_1) \Delta L(D_2)$
2. Run the decider for E_{DFA} on $\langle D \rangle$ and return its output

Symmetric Difference

$$A \Delta B = \{w \mid w \in A \text{ or } w \in B \text{ but not both}\}$$

Countability

Set Theory Review

A function $f: A \rightarrow B$ is

- **1-to-1 (injective)** if $f(a) \neq f(a')$ for all $a \neq a'$
- **onto (surjective)** if for all $b \in B$, there exists $a \in A$ such that $f(a) = b$
- **a correspondence (bijective)** if it is 1-to-1 and onto, i.e., every $b \in B$ has a unique $a \in A$ with $f(a) = b$

How can we compare sizes of infinite sets?

Definition: Two sets have **the same size** if there is a bijection between them

A set is **countable** if

- it is a finite set, or
- it has the same size as \mathbb{N} , the set of natural numbers

Examples of countable sets

- \emptyset
- $\{0,1\}$
- $\{0, 1, 2, \dots 8675309\}$
- $E = \{2, 4, 6, 8, \dots\}$
- $SQUARES = \{1, 4, 9, 16, 25, \dots\}$
- $POW2 = \{1, 2, 4, 8, 16, 32, \dots\}$

$$|E| = |SQUARES| = |POW2| = |\mathbb{N}|$$

How to show that $\mathbb{N} \times \mathbb{N}$ is countable?

| | | | | | |
|--------|--------|--------|--------|--------|-----|
| (1, 1) | (2, 1) | (3, 1) | (4, 1) | (5, 1) | ... |
| (1, 2) | (2, 2) | (3, 2) | (4, 2) | (5, 2) | ... |
| (1, 3) | (2, 3) | (3, 3) | (4, 3) | (5, 3) | ... |
| (1, 4) | (2, 4) | (3, 4) | (4, 4) | (5, 4) | ... |
| (1, 5) | (2, 5) | (3, 5) | (4, 5) | (5, 5) | ... |
| | | | | | ⋮ |
