Review: FAs

Review: Formal Definition

A *finite automaton* is a 5-tuple $M = (Q, \Sigma, \delta, q_0, F)$

Q is the set of states

Σ is the alphabet

$\delta : Q \times \Sigma \rightarrow Q$ is the transition function

$q_0 \in Q$ is the start state

$F \subseteq Q$ is the set of accept states

$L(M)$ = the *language* of machine M

= set of all strings machine M accepts

M *recognizes* the language $L(M)$

Formal definition of FA

$M = (Q, \Sigma, \delta, q_0, F)$ where

$Q = \{q_0, q_1, q_2, q_3\}$

$\Sigma = \{0,1\}$

$\delta : Q \times \Sigma \rightarrow Q$ transition function*

$q_0 \in Q$ is start state

$F = \{q_1, q_2\} \subseteq Q$ accept states

| δ | 0 | 1 |
|----------|---|---|
| q_0 | | |
| q_1 | | |
| q_2 | | |
| q_3 | | |

Regular languages

A language is **regular if it is recognized by a finite automaton**

$L = \{ w \mid w \text{ contains } 001 \}$ is regular

$L = \{ w \mid w \text{ has an even number of } 1\text{s} \}$ is regular

Many interesting programs recognize regular languages

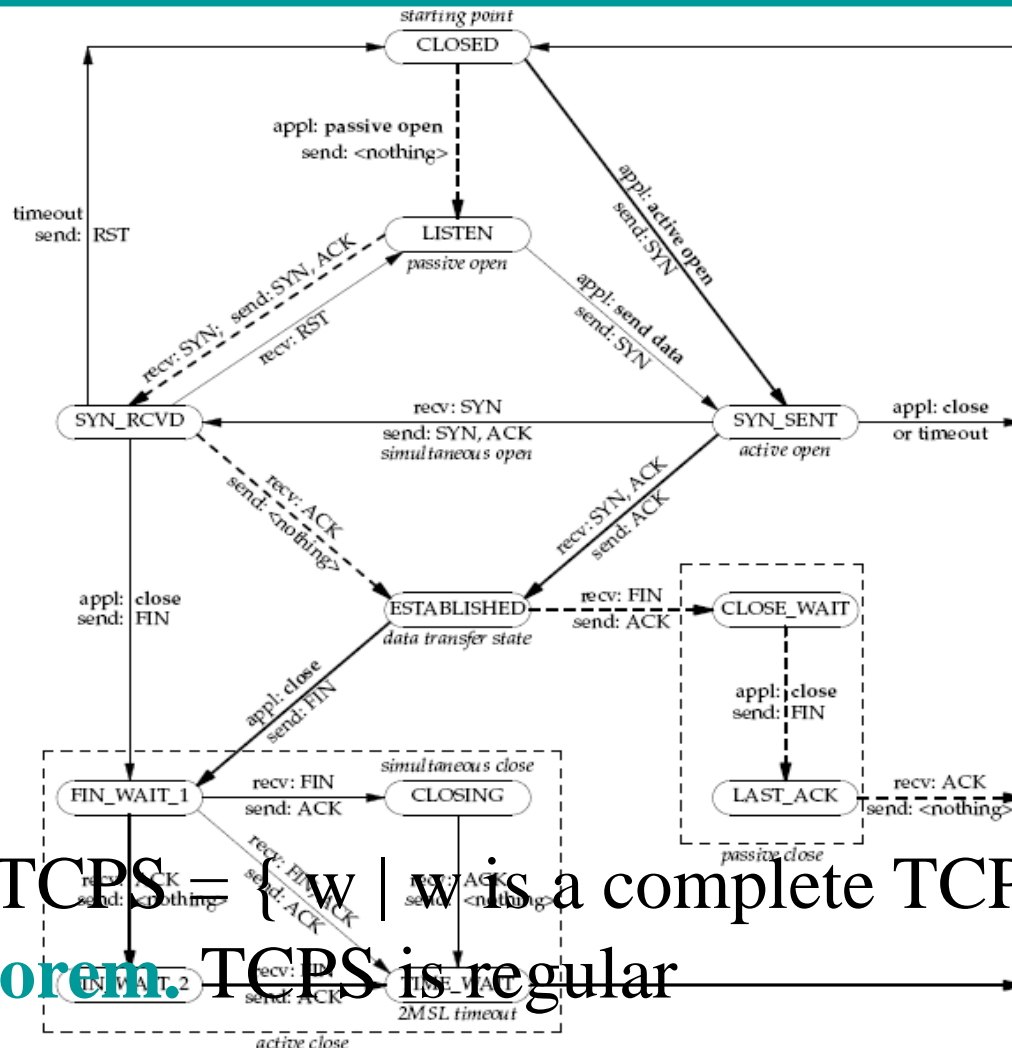

NETWORK PROTOCOLS

COMPILERS

GENETIC TESTING

ARITHMETIC

INTERNET TRANSMISSION CONTROL PROTOCOL

Let $TCP_S = \{w \mid w \text{ is a complete TCP Session}\}$

Theorem. TCP_S is regular

$$\text{LET } \Sigma_3 = \left\{ \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}, \right. \\ \left. \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \\ 1 \end{bmatrix} \right\}$$

- A string over Σ_3 has three ROWS
- Each ROW $b_0b_1b_2\dots b_N$ represents the integer
$$b_0 + 2b_1 + \dots + 2^Nb_N.$$
- Let $\text{ADD} = \{S \mid \text{ROW}_1 + \text{ROW}_2 = \text{ROW}_3\}$

Theorem. ADD is regular.

COMMENTS :

Are delimited by `/* */`

Cannot have **NESTED** `/* */`

Must be **CLOSED** by `*/`

`*/` is **ILLEGAL** outside a comment

COMMENTS = {strings over $\{0,1, /, *\}$ with legal comments}

Theorem. **COMMENTS** is regular.

Genetic testing

DNA SEQUENCES are strings over the alphabet $\{A, C, G, T\}$.

A **GENE** g is a special substring.

A **GENETIC TEST** searches a **DNA SEQUENCE** for a gene.

$\text{GeneticTest}_g = \{\text{strings over } \{A, C, G, T\} \text{ containing a copy of } g\}$

Theorem. GeneticTest_g is regular for every gene g .

Regular Operations on languages

Complement: $\bar{A} = \{w \mid w \notin A\}$

Union:

Intersection:

Reverse:

Concatenation:

Star:

$$= \{\epsilon\} \cup A \cup AA \cup AAA \cup AAAA \cup \dots$$

Closure properties of the class of regular languages

THEOREM. The class of regular languages is **closed** under all 6 operations.

If A and B are regular, applying any of these operation yields a regular language.

Closure properties

Complement: $\bar{A} = \{ w \mid w \notin A \}$

Theorem. The complement of a regular language is also a regular language.

Proof:

Closure properties

Complement: $\overline{A} = \{ w \mid w \notin A \}$

Union: $A \cup B = \{ w \mid w \in A \text{ or } w \in B \}$

Closure under union

Theorem. The union of two regular languages is also a regular language

Proof: Consider two regular languages A_1 and A_2 .

Prove that $A_1 \cup A_2$ is regular.

Let $M_1 = (Q_1, \Sigma, \delta_1, q_0^1, F_1)$ be finite automaton for A_1
and $M_2 = (Q_2, \Sigma, \delta_2, q_0^2, F_2)$ be finite automaton for A_2

**Construct a finite automaton $M = (Q, \Sigma, \delta, q_0, F)$
that recognizes $A = A_1 \cup A_2$**

Example

Proof (continued)

Idea: Run both M_1 and M_2 at the same time!

Q = pairs of states, one from M_1 and one from M_2
 $= \{ (q_1, q_2) \mid q_1 \in Q_1 \text{ and } q_2 \in Q_2 \}$
 $= Q_1 \times Q_2$

$$q_0 = (q_0^1, q_0^2)$$

$$F = \{ (q_1, q_2) \mid q_1 \in F_1 \text{ or } q_2 \in F_2 \}$$

$$\delta((q_1, q_2), \sigma) = (\delta_1(q_1, \sigma), \delta_2(q_2, \sigma))$$

Example (continued)

Closure properties

Complement: $\neg A = \{ w \mid w \notin A \}$

Union: $A \cup B = \{ w \mid w \in A \text{ or } w \in B \}$

Intersection: $A \cap B = \{ w \mid w \in A \text{ and } w \in B \}$

Reverse: $A^R = \{ w_1 \dots w_k \mid w_k \dots w_1 \in A \}$

Closure under reverse

Theorem. The reverse of a regular language is also a regular language

Proof: Let A be a regular language and M be a finite automaton that recognizes it.

Construct a finite automaton M' recognizing A^R .

Idea: Define M' as M with the arrows reversed.
Swap start and accept states.

Closure under reverse

M' IS NOT ALWAYS A DFA!

It may have many start states.

Some states may have too many outgoing edges, or none.

Example

NONDETERMINISM

What happens with **100**?

Nondeterministic Finite Automaton (NFA) accepts if there is a way to make it reach an accept state.
